A Vector Space Approach To Geometry Melvin Hausner:

A Vector Space Approach to Geometry Melvin Hausner, 1965 **A Vector Space Approach to Geometry** Melvin Hausner, 2018-10-17 A fascinating exploration of the correlation between geometry and linear algebra this text also offers elementary explanations of the role of geometry in other branches of math and science 1965 edition **A Gyrovector Space Approach to Hyperbolic Geometry** Abraham Ungar, 2022-06-01 The mere mention of hyperbolic geometry is enough to strike fear in the heart of the undergraduate mathematics and physics student Some regard themselves as excluded from the profound insights of hyperbolic geometry so that this enormous portion of human achievement is a closed door to them The mission of this book is to open that door by making the hyperbolic geometry of Bolyai and Lobachevsky as well as the special relativity theory of Einstein that it regulates accessible to a wider audience in terms of novel analogies that the modern and unknown share with the classical and familiar These novel analogies that this book captures stem from Thomas gyration which is the mathematical abstraction of the relativistic effect known as Thomas precession Remarkably the mere introduction of Thomas gyration turns Euclidean geometry into hyperbolic geometry and reveals mystique analogies that the two geometries share Accordingly Thomas gyration gives rise to the prefix gyro that is extensively used in the gyrolanguage of this book giving rise to terms like gyrocommutative and gyroassociative binary operations in gyrogroups and gyrovectors in gyrovector spaces Of particular importance is the introduction of gyrovectors into hyperbolic geometry where they are equivalence classes that add according to the gyroparallelogram law in full analogy with vectors which are equivalence classes that add according to the parallelogram law A gyroparallelogram in turn is a gyroquadrilateral the two gyrodiagonals of which intersect at their gyromidpoints in full analogy with a parallelogram which is a quadrilateral the two diagonals of which intersect at their midpoints Table of Contents Gyrogroups Gyrocommutative Gyrogroups Gyrovector Spaces Gyrotrigonometry **Analytic Hyperbolic Geometry And Albert Einstein's Special Theory Of Relativity** Abraham Albert Ungar, 2008-02-11 This book presents a powerful way to study Einstein's special theory of relativity and its underlying hyperbolic geometry in which analogies with classical results form the right tool It introduces the notion of vectors into analytic hyperbolic geometry where they are called gyrovectors Newtonian velocity addition is the common vector addition which is both commutative and associative The resulting vector spaces in turn form the algebraic setting for the standard model of Euclidean geometry In full analogy Einsteinian velocity addition is a gyrovector addition which is both gyrocommutative and gyroassociative The resulting gyrovector spaces in turn form the algebraic setting for the Beltrami Klein ball model of the hyperbolic geometry of Bolyai and Lobachevsky Similarly Möbius addition gives rise to gyrovector spaces that form the algebraic setting for the Poincaré ball model of hyperbolic geometry In full analogy with classical results the book presents a novel relativistic interpretation of stellar aberration in terms of relativistic gyrotrigonometry and gyrovector addition Furthermore the book presents for the first time the relativistic center of mass of an isolated system of

noninteracting particles that coincided at some initial time t_0 . The novel relativistic resultant mass of the system concentrated at the relativistic center of mass dictates the validity of the dark matter and the dark energy that were introduced by cosmologists as ad hoc postulates to explain cosmological observations about missing gravitational force and late time cosmic accelerated expansion. The discovery of the relativistic center of mass in this book thus demonstrates once again the usefulness of the study of Einstein's special theory of relativity in terms of its underlying analytic hyperbolic geometry.

A Course in the Geometry of N Dimensions Maurice G. Kendall, 2004-01-01. This text for undergraduate students provides a foundation for resolving proofs dependent on n dimensional systems. The two part treatment begins with simple figures in n dimensions and advances to examinations of the contents of hyperspheres, hyperellipsoids, hyperprisms, etc. The second part explores the mean in rectangular variation, the correlation coefficient in bivariate normal variation, Wishart's distribution, etc. (1961 edition).

Analytic Hyperbolic Geometry Abraham A. Ungar, 2005. This is the first book on analytic hyperbolic geometry fully analogous to analytic Euclidean geometry. Analytic hyperbolic geometry regulates relativistic mechanics just as analytic Euclidean geometry regulates classical mechanics. The book presents a novel gyrovector space approach to analytic hyperbolic geometry fully analogous to the well known vector space approach to Euclidean geometry. A gyrovector is a hyperbolic vector. Gyrovectors are equivalence classes of directed gyrosegments that add according to the gyroparallelogram law just as vectors are equivalence classes of directed segments that add according to the parallelogram law. In the resulting gyrolanguage of the book one attaches the prefix gyro to a classical term to mean the analogous term in hyperbolic geometry. The prefix stems from Thomas gyration which is the mathematical abstraction of the relativistic effect known as Thomas precession. Gyrolanguage turns out to be the language one needs to articulate novel analogies that the classical and the modern in this book share. The scope of analytic hyperbolic geometry that the book presents is cross disciplinary involving nonassociative algebra, geometry and physics. As such it is naturally compatible with the special theory of relativity and particularly with the nonassociativity of Einstein velocity addition law. Along with analogies with classical results that the book emphasizes there are remarkable disanalogies as well. Thus for instance unlike Euclidean triangles the sides of a hyperbolic triangle are uniquely determined by its hyperbolic angles. Elegant formulas for calculating the hyperbolic side lengths of a hyperbolic triangle in terms of its hyperbolic angles are presented in the book. The book begins with the definition of gyrogroups which is fully analogous to the definition of groups. Gyrogroups both gyrocommutative and non gyrocommutative abound in group theory. Surprisingly the seemingly structureless Einstein velocity addition of special relativity turns out to be a gyrocommutative gyrogroup operation. Introducing scalar multiplication some gyrocommutative gyrogroups of gyrovectors become gyrovector spaces. The latter in turn form the setting for analytic hyperbolic geometry just as vector spaces form the setting for analytic Euclidean geometry. By hybrid techniques of differential geometry and gyrovector spaces it is shown that Einstein Minkowski gyrovector spaces form the setting for Beltrami-Klein-Poincaré ball models.
