Androgenesis And Haploid Plants Androgenesis And Haploid Plants:

Androgenesis and Haploid Plants Yves Chupeau, 1998-05-20 Jointly published with INRA Paris The use of haploid plants is of increasing importance in plant biology and plant breeding This book illustrates how the advances in plant molecular and cell biology provide an exciting means for the analysis of androgenesis in terms of pollen development and the initiation of embryogenesis It provides both an appraisal of techniques and their practical application and is the most up to date source of information about the biology of gametophytes **Transgenic Plants and Crops** George C.

Khachatourians, Y. H. Hui, Ralph Scorza, Wai-Kit Nip, 2002-03-26 With contributions from nearly 130 internationally renowned experts in the field this reference details advances in transgenic plant construction and explores the social political and legal aspects of genetic plant manipulation It provides analyses of the history genetics physiology and cultivation of over 30 species of transgenic seeds fruits and vegetables Stressing the impact of genetic engineering strategies on the nutritional and functional benefit of foods as well as on consumer health and the global market economy the book covers methods of gene marking transferring and tagging public perceptions to the selective breeding hybridization and recombinant DNA manipulation of food **Advances in Haploid Production in Higher Plants** Alisher Touraev, Brian P. Forster, Shri Mohan Jain, 2008-12-18 The importance of haploids is well known to geneticists and plant breeders The discovery of anther derived haploid *Datura* plants in 1964 initiated great excitement in the plant breeding and genetics communities as it offered shortcuts in producing highly desirable homozygous plants Unfortunately the expected revolution was slow to materialise due to problems in extending methods to other species including genotypic dependence recalcitrance slow development of tissue culture technologies and a lack of knowledge of the underlying processes Recent years have witnessed great strides in the research and application of haploids in higher plants After a lull in activities drivers for the resurgence have been 1 development of effective tissue culture protocols 2 identification of genes controlling embryogenesis and 3 large scale and wide spread commercial up take in plant breeding and plant biotechnology arenas The first major international symposium on Haploids in Higher Plants took place in Guelph Canada in 1974 At that time there was much excitement about the potential benefits but in his opening address Sir Ralph Riley offered the following words of caution I believe that it is quite likely that haploid research will contribute cultivars to agriculture in several crops in the future However the more extreme claims of the enthusiasts for haploid breeding must be treated with proper caution Plant breeding is subject from time to time to sweeping claims from enthusiastic proponents of new procedures Androgenesis and Haploid Plants Yves

Introduction to Plant Biotechnology H. S. Chawla, 2002 Plant biotechnology has created unprecedented opportunities for the manipulation of biological systems of plants To understand biotechnology it is essential to know the basic aspects of genes and their organization in the genome of plant cells This text on the subject is aimed at students

In vitro Haploid Production in Higher Plants S. Mohan Jain, S.K. Sopory, R.E. Veilleux, 2013-11-27 Since the beginning of agricultural production there has been a continuous effort to grow more and better quality food to feed ever increasing populations Both improved cultural practices and improved crop plants have allowed us to divert more human resources to non agricultural activities while still increasing agricultural production Malthusian population predictions continue to alarm agricultural researchers especially plant breeders to seek new technologies that will continue to allow us to produce more and better food by fewer people on less land Both improvement of existing cultivars and development of new high yielding cultivars are common goals for breeders of all crops In vitro haploid production is among the new technologies that show great promise toward the goal of increasing crop yields by making similar germplasm available for many crops that was used to implement one of the greatest plant breeding success stories of this century i.e. the development of hybrid maize by crosses of inbred lines One of the main applications of anther culture has been to produce diploid homozygous pure lines in a single generation thus saving many generations of backcrossing to reach homozygosity by traditional means or in crops where self pollination is not possible Because doubled haploids are equivalent to inbred lines their value has been appreciated by plant breeders for decades The search for natural haploids and methods to induce them has been ongoing since the beginning of the 20th century
