Andrej Băna, Michael A Slawinski, 2011-05-09 This textbook incorporated with many illuminating examples and exercises is aimed at graduate students of physical sciences and engineering The purpose is to provide a background of physics and underlying mathematics for the concept of rays filling the gap between mathematics and physics textbooks for a coherent treatment of all topics The authors emphasis and extremely good presentation of the theory of characteristics which defines the rays accentuate the beauty and versatility of this theory To this end the rigour of the formulation by a pure mathematician s standards is downplayed to highlight the physical meaning and to make the subject accessible to a wider audience The authors describe in detail the theory of characteristics for different types of differential equations the applications to wave propagation in different types of media and the phenomena such as caustics      **Computable**

**Foundations for Economics** K. Vela Velupillai, 2012-07-26 Computable Foundations for Economics is a unified collection of essays some of which are published here for the first time and all of which have been updated for this book on an approach to economic theory from the point of view of algorithmic mathematics By algorithmic mathematics the author means computability theory and constructive mathematics This is in contrast to orthodox mathematical economics and game theory which are formalised with the mathematics of real analysis underpinned by what is called the ZFC formalism i e set theory with the axiom of choice This reliance on ordinary real analysis and the ZFC system makes economic theory in its current mathematical mode completely non algorithmic which means it is numerically meaningless The book provides a systematic attempt to dissect and expose the non algorithmic content of orthodox mathematical economics and game theory and suggests a reformalization on the basis of a strictly rigorous algorithmic mathematics This removes the current schizophrenia in mathematical economics and game theory where theory is entirely divorced from algorithmic applicability for experimental and computational exercises The chapters demonstrate the uncomputability and non constructivity of core areas of general equilibrium theory game theory and recursive macroeconomics The book also provides a fresh look at the kind of behavioural economics that lies behind Herbert Simon s work and resurrects a role for the noble classical traditions of induction and verification viewed and formalised now algorithmically It will therefore be of particular interest to postgraduate students and researchers in algorithmic economics game theory and classical behavioural economics      Proceedings of the Dirac

anti matter The Dirac Centennial Symposium commemorated the contributions of Dirac to all areas of physics and assessed their impact on frontier research This book constitutes the proceedings of the symposium containing articles by Leopold Halpern Pierre Ramond Frank Wilczek Maurice Goldhaber Jonathan Bagger Joe Lykken Roman Jackiw Stanley Deser Joe Polchinski Andre Linde and others A special contribution from Dirac s daughter Monica Dirac presents a portrait of Paul Dirac as father and family man

**Distributions** Jacques Simon,2022-08-19 This book presents a simple and original theory of distributions both real and vector adapted to the study of partial differential equations It deals with value distributions in a Neumann space that is in which any Cauchy suite converges which encompasses the Banach and Frchet spaces and the same weak spaces Alongside the usual operations derivation product variable change variable separation restriction extension and regularization Distributions presents a new operation weighting This operation produces properties similar to those of convolution for distributions defined in any open space Emphasis is placed on the extraction of convergent subsequences the existence and study of primitives and the representation by gradient or by derivatives of continuous functions Constructive methods are used to make these tools accessible to students and engineers

*The New Era in American Mathematics, 1920-1950* Karen Hunger Parshall, 2022-02-22 The 1920s witnessed the birth of a serious mathematical research community in America Prior to this mathematical research was dominated by scholars based in Europe but World War I had made the importance of scientific and technological development clear to the American research community resulting in the establishment of new scientific initiatives and infrastructure Physics and chemistry were the beneficiaries of this renewed scientific focus but the mathematical community also benefitted and over time began to flourish Over the course of the next two decades despite significant obstacles this

constellation of mathematical researchers programs and government infrastructure would become one of the strongest in the world In this meticulously researched book Karen Parshall documents the uncertain but ultimately successful rise of American mathematics during this time Drawing on research carried out in archives around the country and around the world as well as on the secondary literature she reveals how geopolitical circumstances shifted the course of international mathematics She provides surveys of the mathematical research landscape in the 1920s 30s and 40s introduces the key players and institutions in mathematics at that time and documents the effect of the Great Depression and the second world war on the international mathematical community The result is a comprehensive account of the shift of mathematics center of gravity to the American stage

**The Oxford Handbook of the History of Mathematics** Eleanor Robson, Jacqueline Stedall, 2008-12-18 This Handbook explores the history of mathematics under a series of themes which raise new questions about what mathematics has been and what it has meant to practice it It addresses questions of who creates mathematics who uses it and how A broader understanding of mathematical practitioners naturally leads to a new appreciation of what counts as a historical source Material and oral evidence is drawn upon as well as an unusual array of textual sources Further the ways in which people have chosen to express themselves are as historically meaningful as the contents of the mathematics they have produced Mathematics is not a fixed and unchanging entity New questions contexts and applications all influence what counts as productive ways of thinking Because the history of mathematics should interact constructively with other ways of studying the past the contributors to this book come from a diverse range of intellectual backgrounds in anthropology archaeology art history philosophy and literature as well as history of mathematics more traditionally understood The thirty six self contained multifaceted chapters each written by a specialist are arranged under three main headings Geographies and Cultures Peoples and Practices and Interactions and Interpretations Together they deal with the mathematics of 5000 years but without privileging the past three centuries and an impressive range of periods and places with many points of cross reference between chapters The key mathematical cultures of North America Europe the Middle East India and China are all represented here as well as areas which are not often treated in mainstream history of mathematics such as Russia the Balkans Vietnam and South America A vital reference for graduates and researchers in mathematics historians of science and general historians
