1. The major source of energy for most biological processes is the sun. The sun's energy is converted into chemical energy by photosynthesis, which is the process by which plants and other photosynthetic organisms convert light energy into chemical energy. This process is essential for the survival of most life forms on Earth. The energy from the sun is used to drive the synthesis of organic molecules, such as carbohydrates, lipids, and proteins, which are the building blocks of life. The energy from the sun is also used to drive the synthesis of nucleic acids, which are the genetic material of life. The energy from the sun is also used to drive the synthesis of other biological molecules, such as hormones and enzymes, which are essential for the functioning of the organism.
