

## Science 2C: Kingdom Spotlight- Monerans and Protists.

Warm-up: Can you describe one unique trait of each that no other group has?

Can you describe a kingdom with **brevity**? Can you get me to guess it?

—Kingdom Spotlight— Monerans — Bacteria, slime molds

Monerans are the most **basic** and **oldest** forms of life.

Monerans do not contain major organ cell structures.  
**Organelles**

The moneran cell...

**Move:** It uses those tentacles, or its cell membrane, to wiggle about.

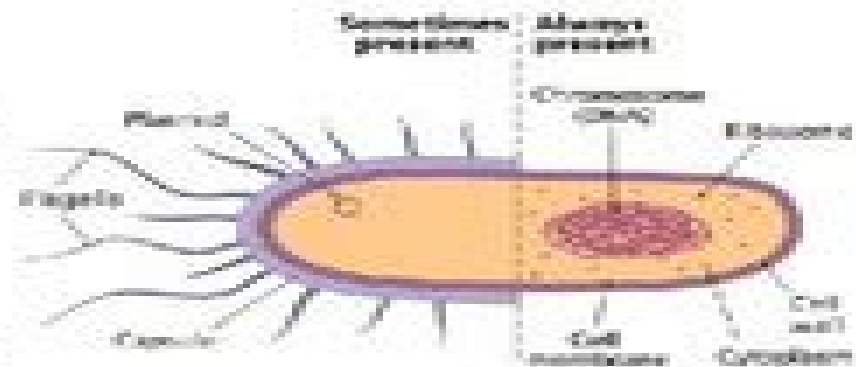

**Eat:** Pili used. This is how the cell consumes nutrients, the cell allows food to enter and waste to leave.

Pili used. Pili use chemicals to break down material. Some kinds of monerans can even break down inorganic compounds, like hydrogen sulfide, and can survive deep under the ocean by thermal vents.

Generally, monerans are specialized to consume one sort of energy source as they lack the complexity to survive on different nutrients. Then again, you can stand in the sun all you want but you are not going to do photosynthesis. But you can consume different kinds of food (protein, fat, sugar) while monerans are limited to one sort of energy source.

Sometimes a moneran is covered by a cell wall, or a capsule (armor), or neither. The cell membrane allows for material to enter and exit in the cell. **Nutrients in / waste out!**

**Replicate:** Its DNA is not in a nucleus, it's just in the cell. The Ribosomes help read the DNA and make more if the cell wants to make another copy of itself.

Friedlander, 1987-02-20 **Mechanisms and Phylogeny of Mineralization in Biological Systems** Shoichi Suga, Hiroshi Nakahara, 2012-12-06 Various kinds of mineralization have been found in many biological systems Investigations made at a microscopical level using various sophisticated analytical methods and using principles developed in different fields have clarified their mechanisms very much Sometimes very similar phenomena have been found in the mineralized tissues of completely different biological systems Compilation and comparative investigations of such findings obtained from the many specimens systematically collected contribute a great deal to an understanding of the crucial mechanisms and significance of biomineralization which originated in very primitive organisms and remain in advanced ones Previously the functional significance of mineralized tissues was considered mainly from an anatomical point of view based upon their morphological and structural features However the recent advance of investigations has made it possible to interpret the functional significance of biomineralization not only from local and mechanical points of view but also from a systemic and phylogenetic point of view It is also well known that biomineralization has contributed in various

ways to geological and oceanographical conditions of the environment in which the organisms were living During this process the mechanisms of biomineralization may have evolved to maintain harmony between organisms and their environments
