Nuclear Science Abstracts, 1962 NSA is a comprehensive collection of international nuclear science and technology literature for the period 1948 through 1976 pre dating the prestigious INIS database which began in 1970 NSA existed as a printed product Volumes 1 33 initially created by DOE s predecessor the U S Atomic Energy Commission AEC NSA includes citations to scientific and technical reports from the AEC the U S Energy Research and Development Administration and its contractors plus other agencies and international organizations universities and industrial and research organizations References to books conference proceedings papers patents dissertations engineering drawings and journal articles from worldwide sources are also included Abstracts and full text are provided if available Analysis and Enumeration Andrea Marino, 2015-03-23 In this work we plan to revise the main techniques for enumeration algorithms and to show four examples of enumeration algorithms that can be applied to efficiently deal with some biological problems modelled by using biological networks enumerating central and peripheral nodes of a network enumerating stories enumerating paths or cycles and enumerating bubbles Notice that the corresponding computational problems we define are of more general interest and our results hold in the case of arbitrary graphs Enumerating all the most and less central vertices in a network according to their eccentricity is an example of an enumeration problem whose solutions are polynomial and can be listed in polynomial time very often in linear or almost linear time in practice Enumerating stories i e all maximal directed acyclic subgraphs of a graph G whose sources and targets belong to a predefined subset of the vertices is on the other hand an example of an enumeration problem with an exponential number of solutions that can be solved by using a non trivial brute force approach Given a metabolic network each individual story should explain how some interesting metabolites are derived from some others through a chain of reactions by keeping all alternative pathways between sources and targets Enumerating cycles or paths in an undirected graph such as a protein protein interaction undirected network is an example of an enumeration problem in which all the solutions can be listed through an optimal algorithm i e the time required to list all the solutions is dominated by the time to read the graph plus the time required to print all of them By extending this result to directed graphs it would be possible to deal more efficiently with feedback loops and signed paths analysis in signed or interaction directed graphs such as gene regulatory networks Finally enumerating mouths or bubbles with a source s in a directed graph that is enumerating all the two vertex disjoint directed paths between the source s and all the possible targets is an example

of an enumeration problem in which all the solutions can be listed through a linear delay algorithm meaning that the delay between any two consecutive solutions is linear by turning the problem into a constrained cycle enumeration problem Such patterns in a de Bruijn graph representation of the reads obtained by sequencing are related to polymorphisms in DNA or RNA seq data **Workbook for Radiologic Science for Technologists - E-Book** Elizabeth Shields, Stewart C.
