Plants' Responses to Novel Environmental Pressures Alessio Fini, Massimiliano Tattini, Raquel Esteban, 2018-02-01 Plants have been exposed to multiple environmental stressors on long term seasonal and short term daily basis since their appearance on land However the frequency and the intensity of stress events have increased much during the last three decades because of climate change Plants have developed however a multiplicity of modular and highly integrated strategies to cope with challenges imposed by novel usually harsher environments These

strategies include migration acclimation and adaptation Twelve articles in this research topic exactly focus on the relative significance of these response mechanisms for the successful acclimation of plants to a wide range of novel environmental pressures Four articles additionally explore how plants respond to severe stress conditions resulting from the concurrent action of multiple stressors Ten articles mostly examine how morpho anatomical physiological and biochemical related traits integrate when plants suffer from novel threats such as solid gaseous and electromagnetic pollutants Suitable physiological indicators for developing conservation strategies are described in the last two works This research topic highlights that bottom up as well as top down approaches will be necessary to develop in near future in the study of plants responses to environmental pressures

*Engineering Rumen Metabolic Pathways: Where We Are, and Where Are We Heading Emilio M. Ungerfeld, C. James Newbold, 2018-03-13* Ruminants were domesticated in the Middle East about 10 000 years ago and have since become an inseparable part of human diet society and culture Ruminants can transform inedible plant fiber and non protein nitrogen into meat milk wool and traction thus allowing human utilization of non tillable land and industrial by products The nutritional flexibility of ruminants is conferred by the rumen s complex microbial community Driven by rising income and population growth in emergent economies the global demand for livestock products including milk and meat from ruminants has been increasingly growing and is predicted to continue growing in the next few decades The increase in production necessary to satisfy this rising demand is putting much pressure on already dwindling natural resources There are also concerns about the emissions of methane and nitrous oxide potent greenhouse gases associated to ruminant production The need to make ruminant production more efficient in the use of natural resources poses a big challenge to ruminant science and within it rumen microbiology Recent years have seen important advances in basic and applied rumen microbiology and biochemistry The knowledge generated has significant implications for the efficiency and sustainability of

ruminant production and the quality of ruminant products for human health The present compilation is an update of recent advances in rumen microbiology and ruminant digestion and fermentation including original research reviews and hypothesis and theory articles We hope that the experimental results discussion models and ideas presented herein are useful to foster future research contributing to sustainable ruminant production      Diversity of beetles and associated microorganisms Hassan Salem,Peter H. A Severn Barrage Great Britain: Parliament: House of Commons: Energy and Climate Change Committee,2013-06-10 Hafren Power s proposal for an 18km fixed tidal barrage across the Severn estuary between Brean in England and Lavernock Point in Wales is likely to require a very high level of support over many years It is not believed at this stage that the barrage would be competitive with other low carbon technologies Hafren Power have failed to answer the serious environmental concerns about a potential barrage adequately The scale of mitigation measures and compensatory habitat required is unprecedented and questions remain about how a barrage such as the one proposed would comply with EU legislation Tidal energy is a vast resource which remains largely untapped However tidal and marine projects must demonstrate their economic environmental and technological credentials and their ability to gain stakeholder support The Government should consider whether a smaller tidal facility could develop expertise and provide evidence before a decision about scaling up is taken Although construction of the barrage would be privately financed Government support would be required for approximately thirty years through Contracts for Difference CfD or a similar mechanism The long lifecycle of a tidal barrage thought to operate for over 120 years could lower the overall levelised cost of energy but is far too distant a prospect to overcome more immediate concerns The strike price required by Hafren Power is unknown but the ability of the project to compete with other low carbon forms of energy is questionable The likelihood of a high strike price over many years risks eating up an excessively large proportion of the funds available under the Levy Control Framework
