

## Obj. 3.4a-11: Rotational Motion

Circular motion can involve rotation and/or revolutions. Rotation occurs when the object spins around an internal axis. Revolution occurs when the axis lies outside of the object. Some objects do both at the same time! The time it takes for an object to make one rotation or one revolution is called its period.

Linear motion involves concepts we studied last semester such as displacement ( $\Delta x$ ) and velocity ( $\Delta x/\Delta t$ ). Circular motion involves changing an angle ( $\Delta\theta$ ) and angular velocity, but which is how much this angle changes with respect to time ( $\Delta t$ ). Additionally, a rotating or revolving object also can move linearly or tangentially. The displacement is an arc around the circumference ( $\Delta x = r\Delta\theta$ ) the velocity (called tangential velocity ( $v_t$ )) is this displacement over time. It is called tangential as the object's velocity is tangential to the arc.

- As seen from the North Pole, the earth spins CCW once in 24 hours (actually it is slightly less).  
1) and What is the  $\Delta\theta$  in degrees and radians that the earth moves in 1 hour?  
2) What is the Earth's angular velocity and as it rotates in radians per second?  
3) If the earth's radius is about  $6.4 \times 10^6$  meters, what tangential velocity would does an object have at the equator?
