Angiogenesis Biology And Pathology Cold Spring Harbor Perspectives In Medicine:

Angiogenesis: Biology and Pathology Diane R. Bielenberg, Patricia A. D'Amore, 2024 Written and edited by experts in the field this collection provides an overview of recent progress in our understanding of the causal mechanisms essential for angiogenesis and lymphangiogenesis in normal physiology and disease The contributors review how the behavior of endothelial cells is controlled and discuss the regulatory roles of signaling molecules such as vascular endothelial growth factor Notch Wnt VE cadherin and epsins Vascular inflammation immune cell trafficking lipid metabolism microRNAs and the microbiome are also covered in the context of homeostasis and vasculature related pathological conditions

Investigating mechanisms of angiogenesis in health and disease using zebrafish models Zaheer Ali, 2018-12-07 Angiogenesis the growth of blood vessels from an existing vasculature can occur by sprouting from preexisting vessels or by vessel splitting intussusception Pathological angiogenesis drives choroidal neovascularization CNV in age related macular degeneration AMD which is commonly restricted under the retinal pigment epithelium RPE called occult CNV but may also involve vessels penetrating through the RPE into the sub retinal space Pathological vessels are poorly developed insufficiently perfused and highly leaky phenotypes that are considered to drive disease progression and lead to poor prognosis Currently a number of anti angiogenic drugs exists the majority of which target vascular endothelial factor VEGF but although they often are highly beneficial for treating eye diseases in the short term they are generally of limited efficacy in other diseases such as cancer and also have poorer efficacy when used for treatment of eye diseases in the long term A better understanding of the mechanisms underlying pathological angiogenesis can generate new targets for treatment leading to development of better drugs for cancer and retinopathies but perhaps also other angiogenesis dependent diseases in the future In this thesis mechanisms involved in developmental angiogenesis or pathological angiogenesis in the choroid cornea or melanoma was identified These findings highlight the need to further elaborate our knowledge related to angiogenesis in different tissues conditions for a more targeted and potentially effective treatment of diseases in the future In paper I we for the first time identified the choriocapillaries CCs in adult zebrafish and found that occult CNV could be induced by exposing the fish to severe hypoxia Interestingly we found that occult CNV relied on intussusception involving not only de novo generation of intussusceptive pillars but also a previously poorly understood mechanism called pillar splitting This involved HIF VEGF VEGFR2 signaling and evidence that this also occurred in both rats and humans suffering from AMD suggested that the mechanism was conserved and clinically relevant In contrast we found in paper II that the development of CCs in the zebrafish relies on sprouting angiogenesis involve continuous remodeling and delayed maturation of the vasculature in 2D The initial development was found to occur by a unique process of tissue-wide synchronized vasculogenesis As expected VEGFA via VEGFR2 was also critical for the development of these vessels in the zebrafish embryo but surprisingly this was independent on hypoxia inducible factor HIF 1 Inflammatory nuclear factor κ B NF κ B signaling is involved in the progression

of angiogenesis but this signaling pathway has mainly been studied in the inflammatory cells and the role of NF κ B in the endothelial cells during angiogenesis is poorly understood In paper III we found that blocking NF κ B signaling using a specific IKK2 blocker IMD0354 specifically blocks pathological as well as developmental angiogenesis by targeting endothelial cell NF κ B signaling in the endothelial cells Using a rat model for suture induced corneal neovascularization IMD0354 treatment lead to reduced production of inflammatory C C motif chemokine ligand 2 CCL2 C X C motif chemokine ligand 5 CXCL5 and VEGF and thereby reduced pathological corneal angiogenesis in this model Using the zebrafish tumor xenograft model in paper IV we found an association between Microphthalmia associated transcription factor MITF and pigment epithelium derived factor PEDF which was involved in pathological tumor angiogenesis and metastasis Similarly in paper V we used zebrafish transplantation models to study and investigate the use of biocompatible polymers for the delivery of pro angiogenic FGF 2 as a potential treatment strategy for ischemic diseases such as myocardial infarction MI Conclusively this thesis provides new insights into diverse fields of angiogenic assays using zebrafish and reveals new mechanisms of angiogenesis in health and disease This work will hopefully provide a foundation for further studies into occult CNV related to AMD a process that has not been possible to study previously in pre clinical models In addition zebrafish xenograft or other transplantation models used in this work will likely be important to study cancer biology and to develop more attractive pharmaceutical preparations based on biocompatible hydrogels formulated as microspheres in the future

Tumor Angiogenesis Sophia Ran, 2012-02-17 Tumor angiogenesis is the main process responsible for the formation of new blood vessels that promote tumor growth and metastasis This process is driven by potent pro angiogenic factors that are predominant in the tumor environment and are produced by both malignant cells and the host cells recruited to the tumor site Tumor environment is characterized by the imbalance between pro angiogenic and anti angiogenic factors which drives the construction of numerous but structurally defective vessels These poorly perfused and abnormal vessels significantly contribute to the tumor pathology not only by supporting the expansion of the tumor mass but also by promoting chronic inflammation enhancing thrombosis impeding drug delivery and disseminating tumor cells These problems associated with tumor vasculature continue to attract great attention of scientists and clinicians interested in advancing the understanding of tumor biology and development of new drugs This book compiles a series of reviews that cover a broad spectrum of current topics related to the pathology of tumor blood vessels including mechanisms inducing new vessels identification of new targets for inhibition of tumor angiogenesis and potential clinical use of known and novel anti angiogenic therapies The book provides an update on tumor angiogenesis that could be useful for oncologists cancer researchers and biologists with interests in vascular and endothelial cell behavior in the context of cancer
