determinants of food security using general linear models The food security metrics are not strongly correlated For example according to HFIAP as many as 70 percent of households sampled are food insecure but only 2 percent fall below acceptable thresholds measured by FCS Model results show that household education assets and dwelling characteristics are significantly associated with food security according to HFIAS and HFIAP but not with FCS The poor correlation and weak model agreement between the dietary recall metric FCS and the experience based metrics HFIAS and HFIAP call for closer attention to measurement of urban food security Given Africa s urban future our findings highlight the need for an urban oriented comprehensive approach to the food security of urban households
