Abstract: New energy storage materials are an object of study within the framework of the global energy transition. The development of renewable sources is being boosted thanks to stationary energy storage systems such as redox flow batteries (RFBs). This work reports the synthesis of the cobalt-containing Keggin-type polyoxometalates $[\text{CoW}_{12}\text{O}_{42}]^{8-}$ (CoW_{12}) and $[\text{Co}(\text{H}_2\text{O})(\text{SiW}_{11}\text{O}_{39})]^{8-}$ (CoSiW_{11}), which have previously been shown to have applicability in RFBs. These procedures were reassessed to meet the strict requirements associated with the further implementation of RFBs, including fast and affordable synthetic procedures with high reaction yields. In contrast to the lengthy and complicated synthetic approaches published to date, the optimized synthesis reported in this work enables the isolation of the pure crystalline salt of the CoW_{12} anion with a 75% reduction of the time of the whole reaction procedure, eliminating tedious steps such as the recrystallization and including a 20% increased yield. The control of the stoichiometry, fine-tuning of reaction conditions, and the identification of intermediate species, as well as the acidic equilibria taking place during the process, were monitored via thermal, spectroscopic, and structural analyses. In the case of the CoSiW_{11} anion, its preparation was based on a simple and highly efficient procedure. Moreover, promising electrochemical properties were observed with the use of the one-pot synthetic approach, in which the stoichiometric amounts of the starting reagents are dissolved in the supporting electrolyte to be directly implemented as the electrolyte for a RFB.

1. Introduction

Polyoxometalates (POMs) are a rich family of inorganic metal–oxygen clusters that constitute a unique class of compounds [1]. Due to their special reactivity together with their structural and compositional versatility, they are employed in different areas such as materials science [2], catalysis [3], and medicine [4]. The simplest procedures for the synthesis of POMs start from aqueous solutions of $[\text{MO}_4]^{n-}$ ($\text{M} = \text{V}, \text{Mo}, \text{W}$) oxyanions that undergo complex self-assembly processes via acidic condensation equilibria of $[\text{MO}_4]$ polyhedral subunits until the formation of the desired polyanion is achieved [5]. Afterwards, clusters are precipitated by the addition of a suitable counterion (e.g., alkali metals, organic cations). These complex formation equilibria are highly influenced by chemical and physical stimuli; hence, their fine-tuning is a key factor in the control of the formation of the desired POMs with high yield and purity [6]. Extensive research has been carried out over the years on the optimization of the synthetic procedures for the formation of POMs [7]. Consequently, long lists of variables that are crucial for the formation of given clusters have been identified. These include concentration and type of the metal source, ionic strength and pH, sequence of the addition of reagents, and external physical (e.g.,

AN APPROACH FOR SYSTEMATIC EVALUATION OF MATERIALS FOR STRUCTURAL APPLICATION. ,1970 An approach is discussed which will enable the Services the producers and materials engineers to decide upon the type of material evaluation tests which need to be performed for the purposes of obtaining screening selection and design data The necessary tests are indicated by a system which takes into account the system vehicle component environment and operational criteria The system is based upon the preparation of a large number of applications case histories the data from which must be recorded according to a rigid format The compilation of the case histories makes up what is called the Applications Analysis Data Bank The system can be coded so that the case history data can be computer analyzed to answer a number of pertinent questions for which answers are not easily obtainable at present A complete materials evaluation system will consist of three data banks 1 Applications Analysis 2 Material Properties these now exist and 3 Material Evaluation Techniques Examples are shown to demonstrate the workings of the proposed system and the many types of questions which can be answered The necessary steps for the further development of the system are recommended

Fatigue and Fracture of Non-metallic Materials and Structures Andrea Spagnoli,2020-06-23 The mechanics of fracture

and fatigue have produced a huge body of research work in relation to applications to metal materials and structures. However a variety of non metallic materials e.g. concrete and cementitious composites, rocks, glass, ceramics, bituminous mixtures, composites, polymers, rubber and soft matter, bones and biological materials and advanced and multifunctional materials have received relatively less attention despite their attractiveness for a large spectrum of applications related to the components and structures of diverse engineering branches, applied sciences and architecture and to the load carrying systems of biological organisms. This book covers the broad topic of structural integrity of non metallic materials considering the modelling, assessment and reliability of structural elements of any scale. Original contributions from engineers, mechanical materials scientists, computer scientists, physicists, chemists and mathematicians are presented applying both experimental and theoretical approaches.
