Dynamics and Novel Uses Dharam Paul Chaudhary, Sandeep Kumar, Sapna Langyan, 2013-12-03 Maize is a globally important crop mainly utilized as feed food and raw material for diverse industrial applications Among cereals it occupies third place after rice and wheat and is a staple food for a large segment of population worldwide particularly in the Asian as well as African countries This monogram discusses various aspects of nutritional quality of maize such as quality protein maize which has been considered as most significant discovery in enhancing nutritional quality of cereals in terms of increasing the concentration of essential amino acids The biochemistry of starch which is an important industrial product of maize has been discussed in detail Further the role of maize oil which is highly regarded for human consumption as it reduces the blood cholesterol concentration has also been elaborated Naturally maize is a rich source of carotenoids such as beta carotene zeaxanthin lutein cryptoxanthin which have highly diverse health benefits ranging from maintaining normal vision to lowering of oxidative stress The need for biofortification of maize for provitamin A carotenoids and their role in alleviating vision impairments have also been discussed The effect of various biotic and abiotic stresses particularly carbon dioxide and temperature on quality has been discussed thoroughly Many value added products as well as fermented foods that have been produced from maize which is consumed in different forms worldwide are also discussed The aspects related to the maize application as fodder and as a source of malting have also been covered concisely Overall the book provides complete information about various quality aspects of maize The various stakeholders such as maize researchers extension specialists students teachers as well as farmers will be immensely benefitted from this monogram **Genetic Resources,**

Intensified Plant Breeding and Seed Production in Poland Food and Agriculture Organization of the United Nations,1985-01-01 Rye and triticale Barley Maize Pea Soybean Rapeseed Gene banks Seed quality control **Acta Agronomica Hungarica** ,1986 *Induced Mutations in Plant Breeding* W. Gottschalk,G. Wolff,2012-12-06 Mutation breeding has been introduced into modern plant breeding in the early 1940 s In spite of pessimistic predictions the application of experimental mutagenesis has led to encouraging results demonstrating that mutation breeding is a well functioning method in many crops So far more than 500 varieties developed by means of induced mutations have been officially released others have been approved for registration Many mutants with characters of agronomic interest cannot be utilized directly because of their unsatisfying yielding capacities or of other negative traits which are partly due to the pleiotropic action of the mutant genes Sometimes their negative selection value can be overcome by transferring them into the genomes of other varieties According to experience available the efficiency of mutant genes can considerably vary depending on the genotypic background in which they become effective The interactions between mutant genes and genotypic background cannot be predicted Therefore mutants with valuable traits should be crossed with many varieties and strains in order to discern positive and negative interactions In this way genotypes can be selected in which the mutant gene is able to express its action without showing negative by effects This procedure has been used for about 10 years by combining the methods of mutation and crossbreeding Mutation breeding is predominantly used in annual diploid and allo polyloid self fertilizing crops while it causes much more difficulties in cross pollinating species Glucosinolates in Rapeseeds: Analytical Aspects J.-P. Wathelet,2012-12-06 Proceedings of a Seminar in the CEC Programme of Research on Plant Productivity held in Gembloux Belgium October 1 3 1986 *The Impact of Plant Molecular Genetics* Bruno W.S. Sobral,2012-12-06 The impact of molecular genetics on plant breeding and consequently agriculture is potentially enormous Understanding and directing this potential impact is crucial because of the urgent issues that we face concerning sustainable agriculture for a growing world population as well as conservation of the world's rapidly dwindling plant genetic resources This book is largely devoted to the applications of genetic markers that have been developed by the application of molecular genetics to practical problems These are known as DNA markers They have gained a certain notoriety in forensics

but can be used in a variety of practical situations We are going through a period of accelerated breakthroughs in molecular genetics Therefore the authors of each chapter were encouraged to speculate about both current bottlenecks and the future of their subfields of research We can certainly apply molecular genetic tools and approaches to help resolve crucial genetic resource problems that face humanity However little has been discussed with respect to when or how we should use such tools nor to who specifically should use them therefore social and economic analyses are important in the planning stages of projects that are aimed at practical results

Achieving sustainable cultivation of maize Volume 1 Dr Dave Watson, 2017-06-09 Reviews key challenges and advances in maize breeding methods Discusses the development of varieties with enhanced nutritional and other properties such as improved protein content and abiotic stress resistance Summarises key steps being taken to support smallholders growing maize in developing countries

Advances in Agronomy, 1991-12-02 Under new editorial direction Advances in Agronomy both continues its long tradition and expands to include innovative methods and technologies Leading international scientists cover topics in plant and soil sciences biotechnology terrestrial ecosystems and environmental concerns This volume presents three articles devoted to plant productivity and improvement and three articles devoted to advances in soil science This and future volumes will be of interest to agronomists in academic industry and government The field of agronomy has changed greatly since the publication of the first volume of Advances in Agronomy in 1949 Many innovations and advances have occurred yet many challenges remain Key Features Influence of soil structure and physical properties on environmental quality Application of nuclear magnetic resonance spectroscopy to soil chemistry Use of low lignin mutants for improving forage quality Application of DNA markers and genetic strategies to plant improvement
