Roles and mechanisms of parasitism in aquatic microbial communities Télesphore Sime-Ngando, Kevin D. Lafferty, David G. Biron, 2015-07-24 Next Generation Sequencing technologies are increasingly revealing that microbial taxa likely to be parasites or symbionts are probably much more prevalent and diverse than previously thought Every well studied free living species has parasites parasites themselves can be parasitized As a rule of thumb there is an estimated 4 parasitic species for any given host and the better a host is studied the more parasites are known to infect it Therefore parasites and other symbionts should represent a very large number of species and may far outnumber those with free living lifestyles Paradoxically free living hosts which form the bulk of our knowledge of biology may be a minority Microbial parasites typically are characterized by their small size short generation time and high rates of reproduction with simple life cycle occurring generally within a single host They are diverse and ubiquitous in the environment comprising viruses prokaryotes and eukaryotes This Frontiers Research Topic
