### Lesson Objectives

-  Discuss the factors that affect aquatic ecosystems.
-  Identify the major categories of freshwater ecosystems.
-  Describe the importance of estuaries.
-  Describe and compare the distinct ocean zones that make up marine ecosystems.

### Lesson Summary

**Conditions Underwater** Aquatic ecosystems are determined mainly by the depth, flow, temperature, and amount of dissolved nutrients of the water.

- ▶ The **photic zone** is the sunlit upper layer of water where photosynthesis can occur.
- ▶ The **aphotic zone** is the dark lower layer where photosynthesis cannot occur.
- ▶ The benthic zone is found on the bottoms of lakes, streams, and oceans. The organisms that live on the floor of a body of water are called **benthos**.

**Freshwater Ecosystems** Freshwater ecosystems include flowing-water ecosystems, standing-water ecosystems, and freshwater **wetlands**. **Plankton** are common. They form the base of many aquatic food webs.

**Estuaries** **Estuaries** are wetlands formed where rivers meet the sea. They contain a mixture of fresh and salt water. Most of the food produced in estuaries enters food webs as tiny pieces of organic matter, or detritus.

**Marine Ecosystems** Marine ecosystems are found in the ocean.

- ▶ The intertidal zone is the shallowest and closest to land. It is exposed to the rise and fall of tides each day.
- ▶ The coastal ocean is the relatively shallow border of water that surrounds the continents.
- ▶ The open ocean begins at the continental shelf and extends outward. The open ocean can be divided into the photic zone and the aphotic zone.
