

Bonding	Definition	Diagram	Properties
Ionic bonding / compounds	When a metal and a non-metal react together, the metal atom loses electrons to form a positively charged ion and the non-metal gains these electrons to form a negatively charged ion. These oppositely charged ions are strongly attracted by electrostatic forces. This attraction is called an ionic bond.	 sodium ion, Na^+ [2,8] $^+$ chloride ion, Cl^- [2,8,8] $^-$	• Giant ionic lattice structure with very strong electrostatic forces between oppositely charged ions • High melting and boiling points due to strong bonds • When solid, they do not conduct electricity as the ions are held in place • When molten, they conduct electricity as the ions are free to move • When dissolved in water, they conduct electricity as the ions separate and so are free to move
Covalent bonding - Simple molecular substances	When non-metal atoms bond together, they share pairs of electrons to make covalent bonds. The positive nuclei of the bonded atoms are attracted to the shared electrons by electrostatic forces.	 CHEMISTRY C3 Bonding, fullerenes, nanoparticles	• They have strong intramolecular forces but weak intermolecular forces • Low melting and boiling points due to the weak intermolecular forces • Gases or liquids (H_2O) at room temperature • They do not conduct electricity AT ALL because they aren't charged and have no free electrons or ions
Covalent bonding - Giant covalent structures	(Same as above) Two main examples made from Carbon atoms only: → Diamond (4 covalent bonds) → Graphite (3 covalent bonds)	 Diamond Graphite	• High melting and boiling points as lots of energy is needed to break the covalent bonds between the atoms • They do not conduct electricity AT ALL as they do not contain charged particles (excluding graphite) • They are insoluble in water • They are hard
Metallic bonding	Metals have delocalised electrons in the outer shell. There are strong forces of electrostatic forces between the positive metal ions and the shared negative ions.	 Sea of electrons	• High melting and boiling points as the electrostatic force between the metals atoms and the delocalised sea of electrons is strong and needs a lot of energy to break. • Solid at room temperature • They conduct electricity and heat very well because they have delocalised electrons • They're malleable as the ions can slide over each other
