**The Conscious Universe** Menas Kafatos,Robert Nadeau,2012-12-06 Imagine that two people have been chosen to be observers in a scientific experiment involving two photons or quanta of light These photons originate from a single source and travel in opposite directions an equal distance halfway across the known universe to points where each will be measured or observed Now suppose that before the photons are released one observer is magically transported to a point of observation halfway across the known universe and the second observer is magically transported to another point an equal distance in the opposite direction The task of the observers is to record or measure a certain property of each photon with detectors located at the two points so that the data gathered at each can later be compared Even though the photons are traveling from the source at the speed of light each observer would have to wait billions of years for one of the photons to arrive at his observation point Suppose however that the observers are willing to endure this wait because they hope to test the predictions of a mathematical theorem This theorem not only allows for the prospect that there could be a correlation between the observed properties of the two photons but also indicates that this correlation could occur instantly or in no time in spite of the fact that the distance between the observers and their measuring instruments is billions of light years

**The World as I See it** Robert E. Goldburg,1975 [The Non-Local Universe](#) Robert Nadeau,Menas Kafatos,2001-05-31 Classical physics states that physical reality is local a point in space cannot influence another point beyond a relatively short distance However In 1997 experiments were conducted in which

light particles photons originated under certain conditions and traveled in opposite directions to detectors located about seven miles apart The amazing results indicated that the photons interacted or communicated with one another instantly or in no time Since a distance of seven miles is quite vast in quantum physics this led physicists to an extraordinary conclusion even if experiments could somehow be conducted in which the distance between the detectors was half way across the known universe the results would indicate that interaction or communication between the photons would be instantaneous What was revealed in these little known experiments in 1997 is that physical reality is non local a discovery that Robert Nadeau and Menas Kafatos view as the most momentous in the history of science In *The Non Local Universe* Nadeau and Kafatos offer a revolutionary look at the breathtaking implications of non locality They argue that since every particle in the universe has been entangled with other particles like the two photons in the 1997 experiments physical reality on the most basic level is an undivided wholeness In addition to demonstrating that physical processes are vastly interdependent and interactive they also show that more complex systems in both physics and biology display emergent properties and or behaviors that cannot be explained in the terms of the sum of parts One of the most startling implications of non locality in human terms claim the authors is that there is no longer any basis for believing in the stark division between mind and world that has preoccupied much of western thought since the seventeenth century And they also make a convincing case that human consciousness can now be viewed as emergent from and seamlessly connected with the entire cosmos In pursuing this groundbreaking argument the authors not only provide a fascinating history of developments that led to the discovery of non locality and the sometimes heated debate between the great scientists responsible for these discoveries They also argue that advances in scientific knowledge have further eroded the boundaries between physics and biology and that recent studies on the evolution of the human brain suggest that the logical foundations of mathematics and ordinary language are much more similar than we previously imagined What this new knowledge reveals the authors conclude is that the connection between mind and nature is far more intimate than we previously dared to imagine What they offer is a revolutionary look at the implications of non locality implications that reach deep into that most intimate aspect of humanity consciousness

Toward a Theology of Scientific Endeavour Christopher B. Kaiser,2007-01-01 This book explores four foundations of scientific endeavour the cosmos human intelligence cultural beliefs and technological structures and investigates some of the paradoxes each of them raises The concurrent study of all four together reveals several tensions and interconnections among them that point the way to a greater unification of faith and science Kaiser shows that the resolution of these paradoxes inevitably leads us into theological discourse and raises new challenges for theological endeavour In order to address these challenges Kaiser draws on the wider resources of the Judeo Christian tradition and argues for a refocusing of contemporary theology from the perspective of natural science

Einstein, Polanyi, and the Laws of Nature Lydia Jaeger,2012-01-15 What is the relationship between religious belief and the study of nature between theology and science This is the fundamental preoccupation of the three different studies in Einstein Polanyi and the Laws of Nature By exploring the highly original yet little known thought of Michael Polanyi Jaeger highlights the inherent personal investment in any quest for knowledge including the scientific enterprise thus raising the question of the objectivity of human knowledge Considered to be the most incredible mind of the twentieth century Albert Einstein saw scientific research as the fruit of the cosmic religion His response to the question of the relationship between faith and science also receives the close analysis it deserves Finally Jaeger is interested in science's propensity to use the concept of laws of nature an idea also found in the Bible She paves the way for interdisciplinary dialogue by examining the similarities and differences The synthesis of these three complementary studies brings out the collaboration between belief and knowledge thus establishing a bridge between two noble human

activities faith and scientific research It will interest all serious followers of the ongoing science and religion dialogue
