

Chapter 1

Answers to Critical Thinking and Review End of Chapter Questions:

1. Why does a single child born in the United States have a greater effect on the environment than 12 or more children born in a developing country?

Ans: A single child born in a highly developed country such as the United States causes a greater impact on the environment and on resource depletion than do 12 or more children born in a developing country. Many natural resources are used to provide the automobiles, air conditioners, disposable diapers, cell phones, DVD players, computers, clothes, newspapers, athletic shoes, furniture, boats, and other “comforts” of life in highly developed nations. Consumer goods, such as these, require vast materials and energy for production and distribution. Thus, the disproportionately large consumption of resources by the United States affects natural resources and the environment as much as or more than the population explosion in the developing world.

2. Do you think it is possible for the world to sustain its present population of more than 6.9 billion indefinitely? Why or why not?

Ans: The current global ecological footprint of each person is about 2.7 hectares (6.7 acres), which means humans have overshoot our allotment. We can see the short-term results around us—forest destruction, degradation of croplands, loss of biological diversity, declining ocean fisheries, and local water shortages. The long-term outlook, if we do not seriously address our consumption of natural resources, is potentially disastrous. Therefore, it is not likely that we can maintain 6 billion people indefinitely.

3. Is consumption driven more by population than affluence in highly developed countries? Less developed countries? Explain the difference.

Ans: Consumption is the human use of materials and energy. In general the use of resources by consumers in highly developed countries is greatly out of proportion to their numbers. A single child born in a highly developed country may have a greater impact on the environment than 12 children born in developing countries. Many natural resources are required to provide automobiles, air conditioners, disposable diapers, cell phones, DVDs, computers, clothing, etc. in highly developed countries.

4. In this chapter we said the current global ecological footprint is 2.7 hectares (6.7 acres) per person. Do you think it will be higher, lower, or the same in 15 years? Explain your answer.

Ans: Answers will vary

5. How are the concepts of ecological footprint and the IPAT model similar? Which concept do you think is easier for people to grasp?
