

Classifying Sharks using a Dichotomous Key

A classification system is a way of separating a large group of closely related organisms into smaller subgroups. With such a system, identification of an organism is easy. The scientific names of organisms are based on the classification systems of living organisms.

To classify an organism, scientists often use a **dichotomous key**. A **dichotomous key** is a listing of specific characteristics, such as structure and behavior, in such a way that an organism can be identified through a process of elimination.

In this investigation, it is expected that you:

- 1) Use a key to identify 14 shark families.
- 2) Study the method used in phrasing statements in a key.

Procedure

1. Read sentences 1A and 1B of the key. Then study shark 1 in figure A for the characteristics referred to in 1A and 1B. Follow the directions in these sentences and continue with this process until a family name for Shark 1 is determined.

For example, if the shark has an anal fin, and its body is not kite shaped, following the directions of 1A and go directly to sentence 2. If the shark lacks an anal fin or has a kite shaped body, follow the directions of 1B and go to sentence 10.

2. Continue this process with each shark until all animals have been identified. Write the family name on the line below each animal.
3. Use figure 1 as a guide to the anatomical features used in the key.

Biology of Sharks and Their Relatives Jeffrey C. Carrier, Colin A. Simpfendorfer, Michael R. Heithaus, Kara E. Yopak, 2022-06-08 Biology of Sharks and Their Relatives is an award winning and groundbreaking exploration of the fundamental elements of the taxonomy systematics physiology and ecology of sharks skates rays and chimera This edition presents current research as well as traditional models to provide future researchers with solid historical foundations in shark research as well as presenting current trends from which to develop new frontiers in their own work Traditional areas of study such as age and growth reproduction taxonomy and systematics sensory biology and ecology are updated with contemporary research that incorporates emerging techniques including molecular genetics exploratory techniques in artificial insemination and the rapidly expanding fields of satellite tracking remote sensing accelerometry and imaging With two new editors and 90 contributors from the US UK South Africa Portugal France Canada New Zealand Australia India Palau United Arab Emirates Micronesia Sweden Argentina Indonesia Cameroon and the Netherlands this third edition is the most global and comprehensive yet It adds six new chapters representing extensive studies of health stress disease and pathology and social structure and continues to explore elasmobranch ecological roles and interactions with their habitats The book concludes with a comprehensive review of conservation policies management and strategies as well as consideration of the potential effects of impending climate change Presenting cohesive and integrated coverage of key topics and discussing technological advances used in modern shark research this revised edition offers a well rounded picture for students and researchers *Harcourt Science HSP*, 1999-04 Adopted by Rowan Salisbury Schools *Deep-sea Cartilaginous Fishes of the Indian Ocean. over a 16 month interval Constant length observation intervals would have been desirable but are often infeasible in practice We model the sharks paths at short constant length intervals by inferring their behavior feeding vs transiting interpolating their locations and estimating parameters of motion speed and turning angle in environmental and ecological contexts We are interested in inferring regional differences in the sharks behavior and behavioral interaction between them Our method uses particle filters a computational Bayesian technique designed to sequentially model a dynamic system We discuss how resampling is used to approximate arbitrary densities and illustrate its use in a simple example of a particle filter implementation of a state space model We then introduce a particular model formulation that uses conditioning to introduce unobserved parameters for the shark s behaviors We show how the irregularly observed shark locations can be modeled by interpolation as a set of movements at constant length time intervals We use a spline method for generating approximations of the ground truth at these intervals for comparison with our model Finally we demonstrate our model s estimates of the sharks behavioral and ecological parameters of interest on a subset of the observed data

Biology of Sharks and Their Relatives, Second Edition Jeffrey C. Carrier, John A. Musick, Michael R. Heithaus, 2012-04-09 Virtually every area of research associated with sharks and their relatives has been strongly impacted by the revolutionary growth in technology The questions we can now ask are very different than those reported even two decades ago Modern immunological and genetic techniques satellite telemetry and archival tagging modern phylogenetic analysis GIS and bomb dating are just a few of the techniques and procedures that have become a part of our investigative lexicon A modern synthesis of the biology of Chondrichthyans *Biology of Sharks and Their Relatives Second Edition* discusses significant advances in the development and application of new molecular techniques to the understanding of the phylogenetic relationships among and between these groups The book considers the effect of global changes on the status of sharks and their relatives and how advances in technology and analytical techniques have changed not only how we approach problem solving and scientific investigations but how we formulate questions The book also introduces applications of new and novel laboratory devices techniques and field instruments This second edition of the award winning and groundbreaking original exploration of the fundamental elements of the taxonomy systematics physiology and ecology of sharks skates rays and chimera presents cohesive and integrated coverage of key topics and discusses technological advances used in modern shark research Offering a well rounded picture for students and researchers and far above competitors in scope and research this new volume holds a wealth of data on the current status of Chondrichthyan research and provides the basis and springboard for original research Cover photo by Justin Gilligan [Discovering Behaviours in Captive Port Jackson Sharks \(*Heterodontus Portusjacksoni*\) Using Accelerometers](#) Julianna Kadar, 2017 Uncovering how animals utilise their time in the wild is vital to understanding their ecology Continuous observation in a marine environment is not feasible but telemetry devices provide an opportunity for fine scale analysis of movement and behaviour We used accelerometers to investigate activity patterns and behaviours of

the Port Jackson shark *Heterodontus portusjacksoni* with the aim of building a model from captive sharks that can be applied to wild populations We developed techniques to identify behaviours from two types of accelerometers high and low resolution To validate the accelerometer data we identified shark behaviours from multi angle high definition video that was time matched to both types of accelerometer data The low resolution accelerometer Vemco V13AP was used to identify diel patterns and migratory restlessness in captive sharks Wild shark diel patterns and presence data were used as a comparative measure to validate findings The high resolution accelerometer Cefas G6a tested the application of a classification tree method in classifying four behaviours resting swimming vertical swimming against the wall of the enclosure and chewing on prey Through evaluating the ability of two types of accelerometers to identify captive shark behaviour we are validating methods for long term low resolution looking for trends and short term high resolution detailed behaviours observation of wild shark populations
