Progenitor Diversity and Neural Cell Specification in the Central Nervous System Marcos R. Costa, Cecilia Hedin-Pereira, Caroline Rouaux, 2015-12-18 The central nervous system continuously perceives integrates processes and generates information These complex functions rely on the detailed elaboration of its cellular network and on the myriads of individual highly differentiated and specialized cell types classically subdivided into neurons astrocytes and oligodendrocytes The specification of these individual populations begins early during development with less differentiated yet already partly restricted progenitor cells Anatomically located in dedicated germinative niches neural progenitors perceive the influence of diffusible molecules of various natures and concentrations These signals result in the initial specialization of cohorts of progenitors that express unique combinations of transcription factors It is now clearly established that both extrinsic and intrinsic signals act in concert to determine the fate potentials of these progenitor cohorts This limitation increases over time adult neural progenitors being more restricted than their developmental counterparts Nevertheless recent data have shown that the fate restriction of neural progenitors as well as that of their progenies can be overwritten upon selected intrinsic factor expression not only during development but also in adulthood This e book is a collection of original research studies along with review articles that together provide insights into the vast spatiotemporal diversity of neural progenitors and the various factors that govern their fate potential *Genetic features contributing to Eye development and Disease* Ling Zhao, Qingjiong Zhang, Youjin Hu, Jie Zhu, 2022-10-19 *Computational Prediction of Protein Complexes from Protein Interaction Networks* Sriganesh Srihari, Chern Han Yong, Limsoon Wong, 2017-05-30 Complexes of physically interacting

proteins constitute fundamental functional units that drive almost all biological processes within cells. A faithful reconstruction of the entire set of protein complexes, the complexome, is therefore important not only to understand the composition of complexes but also the higher level functional organization within cells. Advances over the last several years, particularly through the use of high throughput proteomics techniques, have made it possible to map substantial fractions of protein interactions, the interactomes, from model organisms including *Arabidopsis thaliana*, a flowering plant; *Caenorhabditis elegans*, a nematode; *Drosophila melanogaster*, fruit fly; and *Saccharomyces cerevisiae*, budding yeast. These interaction datasets have enabled systematic inquiry into the identification and study of protein complexes from organisms. Computational methods have played a significant role in this context by contributing accurate, efficient and exhaustive ways to analyze the enormous amounts of data. These methods have helped to compensate for some of the limitations in experimental datasets, including the presence of biological and technical noise and the relative paucity of credible interactions. In this book, we systematically walk through computational methods devised to date, approximately between 2000 and 2016, for identifying protein complexes from the network of protein interactions, the protein-protein interaction (PPI) network. We present a detailed taxonomy of these methods and comprehensively evaluate them for protein complex identification across a variety of scenarios, including the absence of many true interactions and the presence of false positive interactions, noise in PPI networks. Based on this evaluation, we highlight challenges faced by the methods, for instance, in identifying sparse sub- or small complexes and in discerning overlapping complexes, and reveal how a combination of strategies is necessary to accurately reconstruct the entire complexome.

Multi-omics Application in Exploring Potential Biomarkers Targeting Resistance of Anti-Cancer Drugs Hailin Tang, Diane S. Allen-Gipson, Zhi Tian, Jindong Xie, 2025-04-30. Cancer remains a critical concern in global health due to its high prevalence and mortality rates. Despite significant advancements in the development of anti-cancer drugs, drug resistance continues to pose a major challenge in clinical treatments. Drug resistance may be either intrinsic i.e. pre-existent

resistance present in the tumor cells even before exposure to chemotherapy or acquired resistance i.e induced by drugs during or after treatment of tumors with anticancer compounds Anti cancer treatments such as chemotherapy targeted therapy and immunotherapy are highly genotype related interventions Coding and Non coding RNAs ncRNAs such as microRNAs miRNAs lncRNAs circular RNAs circRNAs and PIWI RNA piRNA have been shown to play important roles in tumor formation and therapeutic resistance lncRNAs can activate DNA damage repair silence tumor suppressor genes and modulate cancer related epigenetic changes at the chromatin level in terms of histone modifications DNA methylation and altering chromatin architecture
