In-situ and In-operando Techniques for Material Characterizations during Battery Operation, 2nd edition Veronica Palomares, Neeraj Sharma, 2023-06-07 Battery material research has been one of the major areas of study in the last 30 years due to the huge impact of battery technology in our daily lives Both the discovery of new materials and their electrochemical optimization requires an in depth and fundamental understanding of the composition and structure at different length scales Local long range structure polymorphism microstructure composite formulation and nanoscale engineering all contribute to a materials innate ability to deliver the best performance as an electrode in a battery Importantly the evolution of all these components during battery function determine essentially all the pertinent battery characteristics such as lifetime and energy storage density For these reasons it is critical to determine materials structure at various length scales in order to be able to predict or understand their properties and propose changes to improve their electrochemical behavior In this sense conventional characterization techniques of the material itself are very useful in the first stages of research but in many cases the use of in situ or in operando characterization techniques provides a unique way of understanding materials performance or evolution during battery operation The challenge becomes greater in terms of experimental design because these techniques involve devising and fabricating specific electrochemical cells that fulfill the requirements of the technique but deliver electrochemical performance akin to a real life device
