Arthropods As Vectors Of Emerging Diseases Arthropods As Vectors Of Emerging Diseases:

Arthropods as Vectors of Emerging Diseases Heinz Mehlhorn, 2012-07-05 Global warming and globalization are the buzzwords of our time. They have nearly reached a religious status and those who deny their existence are considered modern heretics. Nevertheless, the earth has become an overcrowded village traversable within a single day. Thus, it is hardly surprising that besides persons and goods, also agents of disease are easily transported daily from one end of the world to the other, threatening the health and lives of billions of humans and their animals. Agents of diseases: prions, viruses, bacteria, fungi, and parasites are not only transmitted by body contact or direct exchange of bodily fluids but also by means of vectors which belong to the groups of licking or blood sucking arthropods, mites, ticks, insects that live close to humans and their houses. Without a doubt, the recently accelerating globalization supports the import of agents of disease into countries where they never had been or where they had long since been eradicated, leading to a false sense of living on a safe island. These newly imported or reintroduced diseases, called emerging diseases, may lead to severe outbreaks in cases where the countries are not prepared to combat them or in cases where viruses are introduced that cannot be controlled by medications or vaccines. Arthropods are well-known vectors for the spread of diseases. Thus, their invasion from foreign countries and their spreading close to human dwellings must be blocked everywhere in donor and receptor countries using safe and effective measures. This book presents reviews on examples of such arthropod-borne emerging diseases that lurk on the fringes of our crowded megacities. The following topics show that there is an ongoing invasion of potential vectors and that control measures must be used now in order to avoid disastrous outbreaks of mass diseases.

Nanoparticles in the Fight Against Parasites Heinz Mehlhorn, 2016-01-14 This book sheds new light on the use of nanoparticles in the fields of parasitology and public and animal health. Nanotechnology has been used in many fields of research and in practical applications. A special subgroup is represented by the so-called nanobiotechnology, which is a multidisciplinary integration of biotechnology, nanotechnology, chemical processing, material science, and engineering. In the fields of parasitology and public and animal health, this technology has been used to develop systems wherein acaricides and insecticides are included. This technique avoids direct contact of the hosts of parasites, animals, humans, with the insecticides, acaricides, and thus minimizes effects on their health and also the development of resistances of the vectors, ticks, mosquitos, flies, etc. Since actually many original articles on the use of nanoparticles bearing arthropodocides appear in different journals as well as in *Parasitology Research* of Springer, it seems reasonable to check the status quo and to elucidate possible chances of progress. This book will appeal to a wide readership from researchers through veterinarians to professionals working in the conservation, public health, or sustainable agriculture area.

Infectious Diseases and Arthropods Jerome Goddard, 2018-05-04 With the exception of a few tropical medicine schools worldwide, current medical education programs include almost zero discussion of the interface between infectious diseases and entomology.
