Papers on Syntax Z. Harris, 2012-12-06 The selection of papers reprinted here traces the development of syntax from

structural linguistics through transformational linguistics to operator grammar. These three are not opposing views or independent assumptions about language. Rather they are successive stages of investigation into the word combinations which constitute the sentences of a language in contrast to those which do not. Throughout the goal has been to find the systematicities of these combinations and then to obtain each sentence in a uniform way from its parts. In structural analysis the parts were words simple or complex belonging to particular classes or particular sequences of these. In transformational analysis it is found that the parts of a sentence are elementary sentences whose parts in turn are simple words of particular classes. The relation between these two analyses is seen in the existence of an intermediate stage between the two presented in paper 4. From Morpheme to Utterance. A further intermediate stage is presented in the writer's String Analysis of Sentence Structure. Papers on Formal Linguistics I. Mouton, The Hague, 1962, though it was developed after transformations as a syntactic representation for computational analysis. Generalization of both of these analyses leads to operator grammar in which each sentence is derived in a uniform way as a partial ordering of the originally simple words which enter into it. Each step least upper bound of the partial ordering of a word requiring another forms a sentence which is a component of the sentence being analyzed.

**Selected Papers of Demetrios G. Magiros** S.G. Tzafestas, 2012-12-06. The theory of nonlinear oscillations and stability of motion is a fundamental part of the study of numerous real world phenomena. These phenomena particularly auto oscillations of the first and second kind, capture parametric subharmonic and ultraharmonic resonance, asymptotic behavior and orbits stability constitute the core of problems treated in Nonlinear Mechanics and their study is connected with the names of H. Poincaré, A. M. Lyapunov, N. M. Krylov and N. N. Bogolyubov. Professor Demetrios Magiros, a widely known scientist in the theories of oscillations and nonlinear differential equations, has devoted his numerous works to this significant part of modern physical science. His scientific results can be classified in the following way: 1. creation of methods of analysis of subharmonic resonances under the nonlinear effect, 2. determination and analysis of the main modes of nonlinear oscillations on the basis of infinite determinants, 3. analysis of problems of celestial mechanics, 4. classification of stability of solutions of dynamic systems concepts, 5. mathematical analogs of physical and social systems. He has developed new methods and solutions for a great number of difficult problems of nonlinear mechanics.

making a significant contribution to the theory and applications of the field. Urgency, depth of perception of the considered phenomena and practical directness are characteristics of his work.     Foundations of Software Science and Computation Structures Naoki Kobayashi, James Worrell, 2024-04-04 The two open access volumes LNCS 14574 and 14575 constitute the proceedings of the 27th International Conference on Foundations of Software Science and Computation Structures FOSSACS 2024 which took place in Luxembourg in April 2024. The 24 full papers included in this book were carefully reviewed and selected from 79 submissions. They were organized in topical sections as follows: Part I: Infinite games, categorical semantics, automata and synthesis; Part II: Types and programming languages, logic and proofs, infinite state systems.
