Advances in Carbon Dioxide Compression and Pipeline Transportation Processes Andrzej Witkowski, Andrzej Rusin, Mirosław Majkut, Sebastian Rulik, Katarzyna Stolecka, 2015-05-25

Providing a comprehensive analysis of CO₂ compression transportation processes and safety issues for post combustion CO₂ capture applications for a 900 MW pulverized hard coal fired power plant this book assesses techniques for boosting the pressure of CO₂ to pipeline pressure values with a minimal amount of energy Four different types of compressors are examined in detail a conventional multistage centrifugal compressor integrally geared centrifugal compressor supersonic shock wave compressor and pump machines The study demonstrates that the total compression power is closely related to the thermodynamic process and is not determined by compressor efficiency alone Another problem addressed is that of CO₂ pipeline transport from the compressor outlet site to a disposal site under heat transfer conditions The book also features an analysis of simulations and models that are used to determine the maximum safe pipeline distance to subsequent booster stations as a function of inlet pressure ambient temperature thickness of the thermal insulation and ground level heat flux conditions This book focuses on compression as well as transportation processes with particular emphasis on the safety risks related to the transport of CO₂ The most important problem in terms

of environmental protection is ensuring precise and reliable hazard identification As hazards can only be managed effectively if they are properly identified problems involving the discharge and atmospheric dispersion of CO₂ are also discussed

Advanced Distillation Technologies Anton A. Kiss, 2013-02-26 Distillation has historically been the main method for separating mixtures in the chemical process industry. However, despite the flexibility and widespread use of distillation processes, they still remain extremely energy inefficient. Increased optimization and novel distillation concepts can deliver substantial benefits, not just in terms of significantly lower energy use, but also in reducing capital investment and improving eco efficiency. While likely to remain the separation technology of choice for the next few decades, there is no doubt that distillation technologies need to make radical changes in order to meet the demands of the energy-conscious society. Advanced Distillation Technologies: Design, Control, and Applications gives a deep and broad insight into integrated separations using non-conventional arrangements, including both current and upcoming process intensification technologies. It includes: Key concepts in distillation technology; Principles of design, control, sizing, and economics of distillation; Dividing wall column (DWC) design configurations; optimal operation and energy-efficient and advanced control; DWC applications in ternary separations; azeotropic, extractive, and reactive distillation; Heat-integrated distillation column (HIDiC) design; equipment and configurations; Heat pump-assisted applications; MVR, TVR, AHP, CHRP, TAHP, and others; Cyclic distillation technology; concepts, modeling, approach, design, and control issues; Reactive distillation fundamentals; equipment applications; feasibility scheme; Results of rigorous simulations in Mathworks Matlab, Simulink, Aspen Plus, Dynamics, and Custom Modeler. Containing abundant examples and industrial case studies, this is a unique resource that tackles the most advanced distillation technologies all the way from the conceptual design to practical implementation. The author of Advanced Distillation Technologies, Dr Ir Anton A. Kiss, has been awarded the Hoogewerff Jongerenprijs 2013. Find out more website in Dutch.
