Integrated life cycle assessment of concrete structures fib Fédération Internationale du béton, 2013-09-03 Concrete is after water the second most used material The production of concrete in the industrialized countries annually amounts to 1 5 3 tonne per capita and is still increasing This has significant impact on the environment Thus there is an urgent need for more effective use of concrete in structures and their assessment The scope of activities of the fib Task Group 3 7 was to define the methodology for integrated life cycle assessment of concrete structures considering main essential aspects of sustainability such as environmental economic and social aspects throughout the whole life of the concrete structure The aim was to set up basic methodology to be helpful in development of design and assessment tools focused on sustainability of concrete structure within the whole life cycle Integrated Life Cycle Assessment ILCA represents an advanced approach integrating different aspects of sustainability in one complex assessment procedure The integrated approach is necessary to insure that the structure will serve during the whole

expected service life with a maximum functional quality and safety while environmental and economic loads will be kept at a low level. The effective application and quality of results are dependent on the availability of relevant input data obtained using a detailed inventory analysis based on specific regional conditions. The evaluation of the real level of total quality of concrete structure should be based on a detailed ILCA analysis using regionally or locally relevant data sets. *Concrete Reinforcement Corrosion* Peter Pullar-Strecker, 2002. Reinforcement corrosion is the most important cause of deterioration in reinforced concrete structures today. By comparing the different repair methods which have been established during recent years and discussing their advantages and drawbacks, this guide details practical approaches to enable non-specialist investigators to carry out at least some initial investigation themselves and considers the problems of detailed investigations in a way which even the most experienced consultants and their clients will find helpful. **Recent Library**

Additions, 1992. **Concrete Repair, Rehabilitation and Retrofitting II** Mark G. Alexander, Hans-Dieter Beushausen, Frank Dehn, Pilate Moyo, 2008-11-13. The Second International Conference on Concrete Repair, Rehabilitation and Retrofitting ICCRRR 2005 was held in Cape Town, South Africa, from 24-26 November 2008. The Conference followed the very successful First International Conference also in Cape Town in 2005 and continued as a collaborative venture by researchers from the South African Research Programme in Concrete Materials based at the Universities of Cape Town and The Witwatersrand and the Construction Materials Sections at Leipzig University and MFGPA Leipzig in Germany. The background in industry and the state of national infrastructures continues to be highly challenging and demanding. The facts remain that much of our concrete infrastructure deteriorates at unacceptable rates; that we need appropriate tools and techniques to undertake the vast task of sound repair, maintenance and rehabilitation of such infrastructure; and that all this must be undertaken with due cognisance of the limited budgets available for such work. New ways need to be found to extend the useful life of concrete structures cost effectively. Confidence in concrete as a viable construction material into the 21st century needs to be retained and sustained, particularly considering the environmental challenges that the industry and society now face. The conference proceedings contain papers presented at the conference and classified into a total of 12 sub-themes which can be grouped under the three main themes of: i) Concrete durability aspects; ii) Condition assessment of concrete structures; and iii) Concrete repair, rehabilitation and retrofitting. The major interests in terms of submissions exist in the fields of innovative materials for durable concrete construction; integrated service life modelling of reinforced concrete structures; NDE, NDT and measurement techniques; repair methods and materials; and structural strengthening and retrofitting techniques. The large number of high quality papers presented and the wide range of relevant topics covered confirm that these proceedings will be a valued reference for many working in the important fields of concrete durability and repair, and that they will form a suitable base for discussion and provide suggestions for future development and research.
