Objectives

1. Identify the structure and function of the joint.
2. Identify the structure and function of the joint.

Joints are the points where two bones meet. Although they vary considerably in structure, they all have the same function: to allow movement between the bones. There are three general types of joints: fibrous, cartilaginous, and synovial. Each type has its own structure and function. In this lab, you will learn about the structure and function of each type of joint.

Joint Structure and Function The structure of each joint determines its function. Fibrous joints are strong and immovable. Cartilaginous joints are strong and slightly movable. Synovial joints are strong and highly movable. The structure of each joint determines its function. In this lab, you will learn about the structure and function of each type of joint.

Purpose of the Exercise

To identify the structure and function of each type of joint, to identify the structure and function of each type of joint, to identify the structure and function of each type of joint.

Learning Outcomes

1. Identify the structure and function of each type of joint.
2. Identify the structure and function of each type of joint.
3. Identify the structure and function of each type of joint.
4. Identify the structure and function of each type of joint.
5. Identify the structure and function of each type of joint.

Procedure

Procedure A—Types of Joints

1. Identify the structure and function of each type of joint.

Larson,Diane E. Meier,2006-05-29 Since the publication of the third edition of Geriatric Medicine extraordinary advances have occurred in the science of aging and the potential for biomedical research to give us answers to many if not most of the age related disorders that threaten the quality of life in older years At the most basic level the successful mapping of the human genome was declared complete in the fall of 2000 Understanding the map of the human genome is as important as understanding the map of genomes of important laboratory species ranging from the microscopic worms and fruit flies used in most classic genetic studies to rodents such as laboratory mice and eventually to primates on which much of the research on the aging human brain is done The genetic maps of all of these species including our own does not answer clinical questions but it does open the door to dramatic rapid and efficient answers to questions about the genetic polymorphisms related to diseases in humans The telomerase story also unfolded since the third edition Telomerase is an enzyme responsible for maintaining the telomeres the redundant DNA portions at the end of chromosomes whose shortening seems to be linked directly to cell senescence apoptosis and the control over cell death which at the level of the individual cell seems to be linked to the decline of organ function and eventually aging and death within the organism
