Chandler,W. Magnus,2012-12-06 One of the pervasive phenomena in the

history of science is the development of independent disciplines from the solution or attempted solutions of problems in other areas of science. In the Twentieth Century the creation of specialties within the sciences has accelerated to the point where a large number of scientists in any major branch of science cannot understand the work of a colleague in another subdiscipline of his own science. Despite this fragmentation the development of techniques or solutions of problems in one area very often contribute fundamentally to solutions of problems in a seemingly unrelated field. Therefore an examination of this phenomenon of the formation of independent disciplines within the sciences would contribute to the understanding of their evolution in modern times. We believe that in this context the history of combinatorial group theory in the late Nineteenth Century and the Twentieth Century can be used effectively as a case study. It is a reasonably well defined independent specialty and yet it is closely related to other mathematical disciplines. The fact that combinatorial group theory has so far not been influenced by the practical needs of science and technology makes it possible for us to use combinatorial group theory to exhibit the role of the intellectual aspects of the development of mathematics in a clearcut manner. There are other features of combinatorial group theory which appear to make it a reasonable choice as the object of a historical study.

Graduate Algebra: Noncommutative View Louis Halle Rowen, 2008. This book is an expanded text for a graduate course in commutative algebra focusing on the algebraic underpinnings of algebraic geometry and of number theory. Accordingly the theory of affine algebras is featured, treated both directly and via the theory of Noetherian and Artinian modules and the theory of graded algebras is included to provide the foundation for projective varieties. Major topics include the theory of modules over a principal ideal domain and its applications to matrix theory including the Jordan decomposition, the Galois theory of field extensions, transcendence degree, the prime spectrum of an algebra, localization and the classical theory of Noetherian and Artinian rings. Later chapters include some algebraic theory of elliptic curves featuring the Mordell-Weil theorem and valuation theory including local fields. One feature of the book is an extension of the text through a series of appendices. This permits the inclusion of more advanced material such as transcendental field extensions, the discriminant and resultant, the theory of Dedekind domains and basic theorems of rings of algebraic integers. An extended appendix on derivations includes the Jacobian conjecture and Makar-Limanov's theory of locally nilpotent derivations. Gröbner bases can be found in another

appendix Exercises provide a further extension of the text The book can be used both as a textbook and as a reference source
