

## Methods of Histology

Technological progress in various scientific disciplines affords histologists many ways to study cells and tissues. The information desired usually dictates the use of one approach over another or the use of combined approaches. The maximal information attainable with any technique requires familiarity with the technique, an understanding of information output, and an appreciation of its advantages and disadvantages. The following will acquaint you with diverse techniques available to examine living cells, dead cells, and cell components. Histologists use these methods to solve histological problems.

Cell culture permits direct observation of living cells. It is routine because of the use of antibiotics. Cell culture also allows the continual observation, manipulation, and testing of explanted cells without donor jeopardy (Figs. 2-1 and 2-2). It facilitates studying cell differentiation, cell transformations, cytogenetics, cellular metabolism, cell-to-cell interactions, host-parasite relationships, and other biological processes. Cell culture is indispensable in diagnostic virology (Figs. 2-3 and 2-4), vaccine development, and vaccine production.

Implantation of transparent viewing chambers and the exteriorization and transillumination of organs and tissues complement direct observation. Although exteriorization techniques limit observation time, insights about microcirculation and the response of tissues and organs to chemotherapeutic agents have been obtained. Transparent viewing chambers extend the observation period. Neovascularization, cellular differentiation and movement, and other vital processes are studied by these techniques. The anterior chamber of the eye is a naturally occurring viewing chamber used in this approach.

The selective uptake of vital and supravital stains has added to our understanding of cell function, cell structure, and extracellular matrix materials. These stains have low toxicity; they may be injected into a living organism (vital) or used on living cells removed from the organism (supravital).

Oxytetracycline, a broad-spectrum antibiotic, is also a vital stain. At therapeutic dosages, this drug selectively stains all surfaces where bone, cementum, and dentin form (Figs. 2-5 and 2-6). Insights

concerning rates of bone formation, turnover, and maintenance have been obtained through carefully timed, spaced, serial administration of the drug.

Lithium carmine and trypan blue are vital dyes for studying phagocytosis. Janus green B and neutral red are supravital stains used to study mitochondria and lysosomes.

The separation and purification of cell fractions through differential centrifugation and density gradient centrifugation are aids for studying biochemical and metabolic phenomena.

The simplest method for the direct observation of living cells is to remove them from the organism, place them on a slide, and examine them with a phase-contrast microscope (Fig. 3-4) or dark-field microscope.

Examining living cells and tissues is difficult microscopically, because they are

The Minipig in Biomedical Research Peter A. McAnulty, Anthony D. Dayan, Niels-Christian Ganderup, Kenneth L. Hastings, 2011-12-19 The Minipig in Biomedical Research is a comprehensive resource for research scientists on the potential and use of the minipig in basic and applied biomedical research and the development of drugs and chemicals. Written by acknowledged experts in the field and drawing on the authors' global contacts and experience with regulatory authorities and the pharmaceutical and other industries, this accessible manual ranges widely over the biological, scientific, and practical uses of the minipig in the laboratory. Its coverage extends from the minipig's origins, anatomy, genetics, immunology, and physiology to its welfare, health, and husbandry, practical dosing and examination procedures, surgical techniques, and all areas of toxicity testing and the uses of the minipig as a disease model. Regulatory aspects of its use are considered. The reader will find an extensive amount of theoretical and practical information in the pharmacology, ADME, and toxicology chapters, which will help scientists and managers when deciding which species to use in basic research, drug discovery, and pharmacology and toxicology studies of chemicals, biotechnology products, and devices. The book discusses regulatory uses of minipigs in the evaluation of human and veterinary pharmaceuticals, medical devices, and other classes of xenobiotics. It describes features of normal health, normal laboratory values, and common diseases. It also carefully elucidates ethical and legal considerations in their supply, housing, and transport. The result is an all-inclusive and up-to-date manual about the experimental uses of the minipig that describes how to and why and what to expect in the normal combining of enthusiasm and experience with critical assessment of its values and potential problems.

The aesthetics of haemotaphonomy. Policarp Hortolà i Gómez, 2015-04-07 Knowing the aesthetics of a science plays a key role in deciphering its underlying cultural framework. This essay intends to provide insight into the aesthetics of haemotaphonomy by identifying

its stylistic parallels with literature and the visual arts An additional interest of this work is to serve as an example of a procedure for approaching the aesthetics of other sciences The author focuses the aesthetics of science from a novel perspective He conceives it from a neuralistic point of view unbound from the compulsive search for a supposed ideal of beauty Hence this essay does not consider beauty but rather aesthetic movements those that have been found to be self evidently significant and analytically productive in explaining The aesthetic of the science under examination Some opinions on this essay Very interesting James A Marcum Baylor University Thought provoking Susan D Jones University of Minnesota Fascinating Roald Hoffmann 1981 Nobel Prize in Chemistry Cornell University      **Equine Acute Abdomen** Nathaniel A.
