Chapter 2 Job-Order Costing: Calculating Unit Product Costs

Questions

2-1 Job-order costing is used in situations where many different products, each with individual and unique features, are produced each period.

2-2 In absorption costing, all manufacturing costs, both fixed and variable, are assigned to units of product—units are said to *fully absorb* manufacturing costs. Conversely, all nonmanufacturing costs are treated as period costs and they are not assigned to units of product.

2-3 Normal costing systems apply overhead costs to jobs by multiplying a predetermined overhead rate by the actual amount of the allocation incurred by the job.

2-4 Unit product cost is computed by taking the total manufacturing costs assigned to a job and dividing it by the number of units contained in the job.

2-5 The first step is to estimate the total amount of the allocation base (the denominator)

that will be required for next period's estimated level of production. The second step is to estimate the total fixed manufacturing overhead cost for the coming period and the variable manufacturing overhead cost per unit of the allocation base. The third step is to use the cost formula $Y = a + bX$ to estimate the total manufacturing overhead cost (the numerator) for the coming period. The fourth step is to compute the predetermined overhead rate.

2-6 The job cost sheet is used to record all costs that are assigned to a particular job. These costs include direct materials costs traced to the job, direct labor costs traced to the job, and manufacturing overhead costs applied to the job. When a job is completed, the job cost sheet is used to compute the unit product cost.

2-7 Some production costs such as a factory manager's salary cannot be traced to a particular product or job, but rather are incurred as a result of overall production activities. In addition, some production costs such as indirect materials cannot be easily traced to jobs. If these costs are to be
