Recent Advances in Urban Ventilation Assessment and Flow Modelling Riccardo Buccolieri, Jian Hang, 2019-04-23 This book contains twenty one original papers and one review paper published by internationally recognized experts in the Atmosphere Special Issue Recent Advances in Urban Ventilation Assessment and Flow Modelling years 2017 2019 The Special Issue includes contributions on recent experimental and modelling works techniques and developments mainly tailored to the assessment of urban ventilation on flow and pollutant dispersion in cities The study of ventilation is of critical importance as it addresses the capacity with which a built urban structure is capable of replacing the polluted air with ambient fresh air Here ventilation is recognized as a transport process that improves local microclimate and air quality and closely relates to the term breathability The efficiency with which street canyon ventilation occurs depends on the complex interaction between the atmospheric boundary layer flow and the local urban morphology The individual contributions to this Issue are summarized and categorized into four broad topics 1 outdoor ventilation efficiency and application development of ventilation indices 2 relationship between indoor and outdoor ventilation 3 effects of urban morphology and obstacles to ventilation and 4 ventilation modelling in realistic urban districts The results and approaches presented and proposed will be of great interest to experimentalists and modelers and may constitute a starting point for the improvement of numerical simulations of flow and pollutant dispersion in the urban environment for the development of simulation tools and for the implementation of mitigation strategies

Climate Change Modeling Methodology Philip J. Rasch, 2012-12-09 The Earth's average temperature has risen by 1.4 F over the past century and computer models project that it will rise much more over the next hundred years with significant impacts on weather climate and human society Many climate scientists attribute these increases to the build up of greenhouse gases produced by the burning of fossil fuels and to the anthropogenic production of short lived climate pollutants Climate Change Modeling Methodologies Selected Entries from the Encyclopaedia of Sustainability Science and Technology provides readers with an introduction to the tools and analysis techniques used by climate change scientists to interpret the role of these forcing agents on climate Readers will also gain a deeper understanding of the strengths and weaknesses of these models and how to test and assess them The contributions include a glossary of key terms and a concise definition of the subject for each topic as well as recommendations for sources of more detailed information

Large Scale Inverse Problems Mike Cullen, Melina A Freitag, Stefan Kindermann, Robert Scheichl, 2013-08-29 This book is the second volume of a three volume series recording the Radon Special Semester 2011 on Multiscale Simulation Analysis in Energy and the Environment that took place in Linz Austria October 3-7 2011 This volume addresses the common ground in the mathematical and computational procedures required for large scale inverse problems and data assimilation in forefront applications The solution of inverse problems is fundamental to a wide variety of applications such as weather forecasting medical tomography and oil exploration Regularisation techniques are needed to ensure solutions of sufficient quality to be useful and soundly theoretically based This book addresses the common techniques required for all the applications and is thus truly interdisciplinary This collection of survey articles focusses on the large inverse problems commonly arising in simulation and forecasting in the earth sciences For example operational weather forecasting models have between 10⁷ and 10⁸ degrees of freedom Even so these degrees of freedom represent grossly space time averaged properties of the atmosphere Accurate forecasts require accurate initial conditions With recent developments in satellite data there are between 10⁶ and 10⁷ observations each day However while these also represent space time averaged properties the averaging implicit in the measurements is quite different from that used in the models In atmosphere and ocean applications there is a physically based model available which can be used to regularise the problem We assume that there is a set of observations with known error characteristics available over a period of time The basic deterministic technique is to fit a model trajectory to the observations over a period of time to within the observation error Since the model is not perfect the model trajectory has to be corrected which defines the data assimilation problem The stochastic view can be expressed by using an ensemble of model trajectories and calculating corrections to both the mean value and the spread which allow the observations to be fitted by each ensemble member In other areas of earth science only the structure of the model formulation itself is known and the aim is to use the past observation history to determine the unknown model parameters The book records the achievements of Workshop 2 Large Scale Inverse Problems and Applications in the Earth Sciences It involves experts in the theory of inverse problems together with experts working on both theoretical and practical aspects of the techniques by which large inverse problems arise in the earth sciences

Air Pollution Modeling and Its Application XIX Carlos Borrego, Ana Isabel Miranda, 2008-07-22 In 1969 the North Atlantic Treaty Organization NATO established the Committee on Challenges of Modern Society CCMS The subject of air pollution was from

the start one of the priority problems under study within the framework of various pilot studies undertaken by this committee. The organization of a periodic conference dealing with air pollution modelling and its application has become one of the main activities within the pilot study relating to air pollution. The first five international conferences were organized by the United States as the pilot country, the second five by the Federal Republic of Germany, the third five by Belgium, the fourth four by The Netherlands, the next five by Denmark, and the last five by Portugal. This volume contains the abstracts of papers and posters presented at the 29th NATO CCMS International Technical Meeting on Air Pollution Modelling and Its Application held in Aveiro, Portugal, during September 24-28, 2007. This ITM was organized by the University of Aveiro, Portugal, Pilot Country and Host Organization. The key topics distinguished at this ITM included Local and urban scale modelling, Regional and intercontinental modelling, Data assimilation and air quality forecasting, Model assessment and verification, Aerosols in the atmosphere, Interactions between climate change and air quality, Air quality and human health.

Advanced Numerical Methods for Complex Environmental Models: Needs and Availability István Faragó, Ágnes Havasi, Zahari Zlatev, 2013-12-10

High air pollution levels pose a significant threat to plants, animals, and human beings. Efforts by researchers are directed towards keeping air pollution levels below well-defined critical levels in order to maintain a sustainable atmosphere and environmental system. The application of advanced mathematical models is important for researchers to achieve this goal as efficiently as possible. Mathematical models can be used to predict answers to many important questions about the environment. This application comes with several complex theoretical and practical obstacles which need to be resolved. A successfully applicable mathematical model needs to enable researchers to mathematically describe all important physical and chemical processes. Apply fast and sufficiently accurate numerical methods. Ensure that the model runs efficiently on modern high-speed computers. Use high-quality input data, both meteorological data and emission inventories, in the runs. Verify the model results by comparing them with reliable measurements taken in different parts of the spatial domain of the model. Carry out long series of sensitivity experiments to check the response of the model to changes of different key parameters. Visualize and animate the output results in order to make them easily understandable even to non-specialists. This monograph thoroughly describes mathematical methods useful for various situations in environmental modeling, including finite difference methods, splitting methods, parallel computation, etc., and provides a framework for resolving problems posed in relation to the points listed above. Chapters are written by well-known specialists, making this book a handy reference for researchers, university teachers, and students working and studying in the areas of air pollution, meteorology, applied mathematics, and computer science.
