**Performing Digital** David Carlin, Laurene Vaughan, 2016-03-03  
Digital technologies have transformed archives in every area of their form and function, and as technologies mature, so does their capacity to change our understanding and experience of material and performative cultural production. There has been an exponential explosion in the production and consumption of video online, and yet there is a scarcity of knowledge and cases about video and the digital archive. This book seeks to address that through the lens of the project Circus Oz Living Archive. This project provides the case study foundation for the articulation of the issues, challenges, and possibilities that the design and development of digital archives afford. Drawn from eight different disciplines and professions, the authors explore what it means to embrace the possibilities of digital technologies to transform contemporary cultural institutions and their archives into new methods of performance, representation, and history.

**XML and Web Technologies for Data Sciences with R** Deborah Nolan, Duncan Temple Lang, 2013-11-29  
Web technologies are increasingly relevant to scientists working with data, for both accessing data and creating rich, dynamic, and interactive displays. The XML and JSON data formats are widely used in Web services, regular Web pages, and JavaScript code, and visualization formats such as SVG and KML for Google Earth and Google Maps. In addition, scientists use HTTP and other network protocols to scrape data from Web pages, access REST and SOAP Web Services, and interact with NoSQL databases and text search applications. This book provides a practical, hands-on introduction to these technologies, including high-level functions the authors have developed for data scientists. It describes strategies and approaches for extracting data from HTML, XML, and JSON formats and how to programmatically access data from the Web. Along with these general skills, the authors illustrate several applications that are relevant to data scientists, such as reading and writing spreadsheet documents, both locally and via Google Docs, creating interactive and dynamic visualizations, displaying spatial-temporal displays with Google Earth, and generating code from descriptions of data structures to read and

write data These topics demonstrate the rich possibilities and opportunities to do new things with these modern technologies The book contains many examples and case studies that readers can use directly and adapt to their own work The authors have focused on the integration of these technologies with the R statistical computing environment However the ideas and skills presented here are more general and statisticians who use other computing environments will also find them relevant to their work Deborah Nolan is Professor of Statistics at University of California Berkeley Duncan Temple Lang is Associate Professor of Statistics at University of California Davis and has been a member of both the S and R development teams
