## **Aisc Design Guide For Steel Platforms:**

*Design Guides for Offshore...* P. Le Tirant, *Calibration of Deterministic Parameters: Reassessment of Offshore Platforms in the Arabian Gulf* Hassan Zaghloul, 2011-04-18 The Arabian Gulf oil and gas production reserves have made it one of the world's strategic producers since the early 1960s with many of the existing platforms stretched beyond their original design life. Advances in drilling technology and reservoir assessments have extended the requirement for the service life of those existing platforms even further. Extension of the life span of an existing platform requires satisfactory reassessment of its various structural components including piled foundations. The American Petroleum Institute Recommended Practice 2A API RP2A is commonly used in the Arabian Gulf for reassessment of existing platforms. The API guidelines have been developed for conditions in the Gulf of Mexico, the waters off Alaska and the Pacific and Atlantic seabords of the USA. However, the Arabian Gulf conditions are fundamentally different to those encountered in US waters. Hence, there is a need to develop guidelines for reassessment of existing offshore structures to account for the specific conditions of the Arabian Gulf. This thesis performs statistical analyses on databases collected during this research from existing platforms to calibrate relevant load and resistance factors for the required guidelines. The developed guidelines are based on established approaches used in developing international codes and standards such as API RP2A LRFD. The outcome of this research revolves around the following three main issues: 1. Calibration of resistance factors for axial capacity of piles driven in the carbonate soils. 2. Development of open area live loads OALL on offshore platforms. 3. Effect of extreme storm conditions on the reliability of existing platforms in the Arabian Gulf. The outcomes of this research are expected to have a profound influence on reassessment of existing platforms in the Arabian Gulf.

*Design Aids for Offshore Topsides Platforms Under Special Loads* Srinivasan Chandrasekaran, Arvind Kumar Jain, Nasir Shafiq, M. Mubarak A. Wahab, 2021-11-25 Offshore platforms face many risks including a hostile ocean environment, extreme temperatures, overpressure loads, fire risks, and hydrocarbon explosions, all of which pose unique challenges in designing their topside platforms. The topside design also involves the selection of appropriate materials to reduce fire risk without compromising the functional requirements. These platforms serve valuable utility production and processing purposes and can also provide living quarters for personnel. Concepts such as basic design, special design, materials selection, and risk hazards are explained in the authors' straightforward classroom style and are based on their rich experience in both academia and industry. Features include practical examples which are solved using international codes to offer a better understanding of the subjects presented. Addresses safety and risk of offshore platforms and considers numerous topside accident scenarios. Discusses the structural and mechanical properties of various materials such as steel and newer functionally graded materials (FGMs). *Design Aids for Offshore Topsides Platforms Under Special Loads* serves as a design manual for multi-disciplinary engineering graduates and practicing professionals working in civil, mechanical, offshore, naval, and petroleum engineering fields. In addition, the book will serve as a reference manual for

**Index of Specifications and Standards**, *Structural Integrity of Offshore Wind Turbines* Transportation Research Board, 2011-09-02 TRB Special Report 305 Structural Integrity of Offshore Wind Turbines Oversight of Design Fabrication and Installation explores the U S Department of the Interior s Bureau of Ocean Energy Management Regulation and Enforcement BOEMRE approach to overseeing the development and safe operation of wind turbines on the outer continental shelf with a focus on structural safety The committee that developed the report recommended that in order to facilitate the orderly development of offshore wind energy and support the stable economic development of this nascent industry the United States needs a set of clear requirements that can accommodate future design development The report recommends that BOEMRE develop a set of requirements that establish goals and objectives with regard to structural integrity environmental performance and energy generation The committee found that the risks to human life and the environment associated with offshore wind farms are substantially lower than for other industries such as offshore oil and gas because offshore wind farms are primarily unmanned and contain minimal quantities of hazardous substances This finding implies that an approach with significantly less regulatory oversight may be taken for offshore wind farms Under this approach industry would be responsible for proposing sets of standards guidelines and recommended

practices that meet the performance requirements established by BOEMRE The domestic industry can build on standards guidelines and practices developed in Europe where the offshore wind energy is further developed but will have to fill gaps such as the need to address wave and wind loadings encountered in hurricanes The report also includes findings and recommendations about the role that certified verification agents third party evaluators can play in reviewing packages of standards and project specific proposals
