A Source Book in Mathematics, 1200-1800 D. J. Struik, Mathematical Thought From Ancient to Modern Times, Volume 3 Morris Kline, 1990-03-01 This comprehensive history traces the development of mathematical ideas and the careers of the men responsible for them Volume 1 looks at the disciplines origins in Babylon and Egypt the creation of geometry and trigonometry by the Greeks and the role of mathematics in the medieval and early modern periods Volume 2 focuses on calculus the rise of analysis in the 19th century and the number theories of Dedekind and Dirichlet The concluding volume covers the revival of projective geometry the emergence of abstract algebra the beginnings of topology and the influence of Godel on recent mathematical study **Vita Mathematica** Ronald Calinger, 1996 Enables teachers to learn the history of mathematics and then incorporate it in undergraduate teaching *A History of Analysis* Hans Niels Jahnke, 2003 Analysis as an independent subject was created as part of the scientific revolution in the seventeenth century Kepler Galileo Descartes Fermat Huygens Newton and Leibniz to name but a few contributed to its genesis Since the end of the seventeenth century the historical progress of mathematical analysis has displayed unique vitality and momentum No other mathematical field has so profoundly influenced the development of modern scientific thinking Describing this multidimensional historical development requires an in depth discussion which includes a reconstruction of general trends and an examination of the specific problems This volume is designed as a collective work of authors who are proven experts in the history of mathematics It clarifies the conceptual change that analysis underwent during its development while elucidating the influence of specific applications and describing the relevance of biographical and philosophical backgrounds The first ten chapters of the book outline chronological development and the last three chapters survey the history of differential equations the calculus of variations and functional analysis Special features are a separate chapter on the development of the theory of complex functions in the nineteenth century and two chapters on the influence of physics on analysis One is about the origins of analytical mechanics and one treats the development of boundary value problems of mathematical physics especially potential theory in the nineteenth century The book presents an accurate and very readable account of the history of analysis Each chapter provides a comprehensive bibliography Mathematical examples have been carefully chosen so that readers with a modest background in mathematics can follow them It is suitable for mathematical historians and a general mathematical audience **Learning by Discovery** Anita E. Solow, 1993 This book contains 26 laboratory modules for use in coursework or in independent projects **Resources in Education**, 1993 Theoretical Approaches to Non-Numerical Problem Solving R. B. Banerji, M. D. Mesarovic, 2012-12-06 Advances in computer technology have pointed out the next important area of computer applications solution of non numerical problems It is hardly necessary to emphasize the importance of these kind of problems First of all most of the decisions one has to make in real life situations are non numerical in the first instance and can be represented as numerical problems only as approximations which are often only

partially valid Second to use the computer to its full potential it should be employed as a logical machine capable of deduction and not just as a numerical calculating machine Thus the computer would extend man s capability for logical reasoning and not just for his capability to do fast and accurate calculation It is not a new area indeed non numerical problems are central in fields such as artificial intelligence heuristic programming pattern recognition classification and information processing and retrieval etc However it is fair to assess that progress in the area has not been quite as expected One of the reasons was a lack of conceptual and theoretical framework in which to investigate different classes of non numerical problems to improve understanding of various types of problems and methods for their solutions and furthermore to enable the methods which have been proven as effective in one situation to be used in another situation with appropriately similar structure
