

Inheritance in action

How inheritance works

Genes are passed on from parents to offspring. The way chromosomes are passed on is called inheritance. Each parent has two copies of each chromosome. One copy of each chromosome is passed on to the offspring. This is called the **genotype**. The **phenotype** is the physical appearance of an organism. It is determined by the genotype and the environment.

Male (XY) Possible alleles	D	d
D	DD	Dd
d	Dd	dd

Summary questions

- 1 Draw a Punnett square like the ones in the diagram. What are the possible genotypes for a cross between two heterozygous individuals (Dd x Dd)?
- 2 What is the probability of an offspring having dimples (Dd) from a cross between two heterozygous individuals (Dd x Dd)?
- 3 What is the probability of an offspring having no dimples (dd) from a cross between two heterozygous individuals (Dd x Dd)?

Family trees

Family trees show the inheritance of a particular characteristic through a family. They can be used to track the inheritance of a particular characteristic, such as dimples, or to show the inheritance of a disease, such as sickle cell anemia.

Genotypes and phenotypes

- **Genotype** - the genetic makeup of an individual, e.g. Dd, dd
- **Phenotype** - the physical appearance of an individual, e.g. dimples, no dimples
- **Homozygous** - an individual with two identical alleles for a characteristic, e.g. DD, dd
- **Heterozygous** - an individual with two different alleles for a characteristic, e.g. Dd

Genes, known as alleles, can result in the development of different characteristics. For example, the allele for dimples (D) is dominant over the allele for no dimples (d). If you have one of each allele (Dd), you will have dimples. If you have two of the recessive allele (dd), you will not have dimples.
