

VIII. Mechanical Movements Illustrated

1. Illustrating the transmission of power by simple pulleys and an open belt. The pulleys in this case rotate in the same direction.

2. Illustrating the transmission of power by simple pulleys and a crossed belt. The pulleys rotate in opposite directions.

3. Showing the transmission of motion from one shaft to another at right angles to it by means of guide-pulleys. There are four guide-pulleys side by side, one for each end of the belt.

4. Showing the transmission of motion from one shaft to another at right angles to it, without the use of guide-pulleys.

5. Showing a method of engaging, disengaging, and reversing the motion of a belt. The belt is shown on a lower pulley, and accordingly no motion is transmitted to the upper pulley. If the belt is traversed on to the upper pulley, which is fast to the motor shaft, the motion is communicated to the vertical shaft by the belt. If the belt is traversed on to the right-hand pulley, which is fast to the lower shaft, the motion is in opposite direction is transmitted to the vertical shaft by the lower gear and a.

6. Stopped speed-pulleys. On the left of the figure, and in the right and middle, and on the right in the left of the figure, used in moving machinery. At the varying speed according to the requirements of the work being done. For a given speed of the upper shaft the speed of the lower one will be greater the more to the left the belt is moved. The consequence results of more gradualness in speed than the stopped arrangement.

7. Spur-gearing. The wheels rotate in opposite directions. In 10. The smaller wheel has the greater speed of revolution, and the speeds of the wheels are in the inverse ratio of their diameters.

8. Bevel variable friction gear. The driving motion by which motion is transmitted from one motor to the other is a lower friction band, whose position can be varied by the hand-screw shown.

9. Bevel-gearing. This is an adaptation of the spur-wheel principle to the case of non-parallel axes.

10. A worm or endless screw geared with a spur-wheel.

11. Elliptical spur-gearing, used when a rotary motion of varying speed is required.

12. A spur-wheel geared internally with a pinion. The wheels rotate in the same direction. In 11.

13. Spur-gearing with oblique teeth, giving a more continuous running than in 12.

14. Showing the transmission of power by rolling contact from one shaft to another obliquely and with regard to it.

15. Different kinds of gearing for transmitting motion from one shaft to another arranged obliquely to it.

16. Two kinds of universal joints.

17. A method of changing position from one shaft to another to combine the horizontal or vertical of bevel-gearing with a double-motion for altering the direction and rotation. The level-wheel on the horizontal shaft are loose, and the direction of movement is determined by the side upon which the double-motion is engaged. The shaft slides upon a key or leather band on the shaft.

18. Transmission of two speeds by gearing. The belt is shown on the lower wheel, and the lower wheel is fast to the motor shaft. When it is moved on to the upper pulley, which is fast to the shaft carrying the small pinion, a slow motion is transmitted to the lower shaft; but when it is on the right-hand pulley, which is fast to the motor shaft carrying the large spur-wheel, a quick speed is transmitted.

19. Transmission of two speeds by means of belts. The two motor pulleys on the lower shaft are loose, the two lower pulleys. With the belt arranged as shown, the speed of the lower shaft is slow; then when both are traversed to the right.
