

Figure 5.6 — Extent of saddles

In the restoration of these extensive saddles the tooth support offered by the remaining teeth must be augmented by mucosal support derived from extensive palatal coverage.

Figure 5.7 — Extent of saddles

It is of course possible to gain support from more than one tooth. In this instance, occlusal rests have been placed on both premolars so that the forces from the distal extension saddle are distributed widely. However, the occlusal rest on the first premolar will share the supportive function only if there is minimal downward movement of the saddle when a vertical load is applied. A larger movement will cause the rest to rotate away from the tooth.

The expected force on the saddles

Figure 5.8 — The expected force on the saddles

We have already mentioned that the magnitude of force will increase as the artificial occlusal surface increases in area. The magnitude can also be expected to vary with the nature of the opposing dentition. Studies have shown that the functional force created by an opposing denture will be less than that arising from several natural teeth.

Tooth support for distal extension saddles

Figure 5.9 — Tooth support for distal extension saddles

The support of distal extension saddles, especially in the mandibular jaw, is a particular problem and the optimum site for a rest is controversial. One view is that placing a distal rest on the abutment tooth encourages distal tipping of that tooth.
