*Induced Mutations in Plant Breeding* W. Gottschalk, G. Wolff, 2012-12-06 Mutation breeding has been introduced into modern plant breeding in the early 1940 s In spite of pessimistic predictions the application of experimental mutagenesis has led to encouraging results demonstrating that mutation breeding is a well functioning method in many crops So far more than 500 varieties developed by means of induced mutations have been officially released others have been approved for registration Many mutants with characters of agronomic interest cannot be utilized directly because of their unsatisfying yielding capacities or of other negative traits which are partly due to the pleiotropic action of the mutant genes Sometimes their negative selection value can be overcome by transferring them into the genomes of other varieties According to experience available the efficiency of mutant genes can considerably vary depending on the genotypic background in which they become effective The interactions between mutant genes and genotypic background cannot be predicted Therefore mutants with valuable traits should be crossed with many varieties and strains in order to discern positive and negative interactions In this way genotypes can be selected in which the mutant gene is able to express its action without showing negative by effects This procedure has been used for about 10 years by combining the methods of mutation and crossbreeding Mutation breeding is predominantly used in annual diploid and allo polyloid self fertilizing crops while it causes much more difficulties in cross pollinating species

**The Impact of Plant Molecular Genetics** Bruno W.S. Sobral, 2012-12-06 The impact of molecular genetics on plant breeding and consequently agriculture is potentially enormous Understanding and directing this potential impact is crucial because of the urgent issues that we face concerning sustainable agriculture for a growing world population as well as conservation of the world's rapidly dwindling plant genetic resources This book is largely devoted to the applications of genetic markers that have been developed by the application of molecular genetics to practical problems These are known as DNA markers They have gained a certain notoriety in forensics

but can be used in a variety of practical situations We are going through a period of accelerated breakthroughs in molecular genetics Therefore the authors of each chapter were encouraged to speculate about both current bottlenecks and the future of their subfields of research We can certainly apply molecular genetic tools and approaches to help resolve crucial genetic resource problems that face humanity However little has been discussed with respect to when or how we should use such tools nor to who specifically should use them therefore social and economic analyses are important in the planning stages of projects that are aimed at practical results      Achieving sustainable cultivation of maize Volume 1 Dr Dave Watson,2017-06-09 Reviews key challenges and advances in maize breeding methods Discusses the development of varieties with enhanced nutritional and other properties such as improved protein content and abiotic stress resistance Summarises key steps being taken to support smallholders growing maize in developing countries      **Advances in Agronomy**,1991-12-02 Under new editorial direction Advances in Agronomy both continues its long tradition and expands to include innovative methods and technologies Leading international scientists cover topics in plant and soil sciences biotechnology terrestrial ecosystems and environmental concerns This volume presents three articles devoted to plant productivity and improvement and three articles devoted to advances in soil science This and future volumes will be of interest to agronomists in academic industry and government The field of agronomy has changed greatly since the publication of the first volume of Advances in Agronomy in 1949 Many innovations and advances have occurred yet many challenges remain Key Features Influence of soil structure and physical properties on environmental quality Application of nuclear magnetic resonance spectroscopy to soil chemistry Use of low lignin mutants for improving forage quality Application of DNA markers and genetic strategies to plant improvement      **Plant Breeding Reviews, Volume 14** Jules Janick,2010-04-07 A state of the art overview on important topics relating to the breeding of agriculturally and horticulturally important plants It continually monitors developments in plant breeding research and covers major field crops horticultural crops and specialties
