crisis that has followed have drawn attention to weaknesses in financial records information and data. These weaknesses have led to operational risks in financial institutions, flawed bankruptcy and foreclosure proceedings following the Crisis, and inadequacies in financial supervisors' access to records and information for the purposes of a prudential response. Research is needed to identify the practices that will provide the records information and data needed to support more effective financial analysis and risk management. The unique contribution of this volume is in bringing together researchers in distinct domains that seldom interact to identify theoretical, technological, policy and practical issues related to the management of financial records information and data. The book will therefore appeal to researchers or advanced practitioners in the field of finance and those with an interest in risk management, computer science, cognitive science, sociology, management information systems, information science and archival science as applied to the financial domain.

Hagenberg Business Process Modelling Method Felix Kossak, Christa

Illibauer, Verena Geist, Christine Natschläger, Thomas Ziebermayr, Bernhard Freudenthaler, Theodorich Kopetzky, Klaus-Dieter Schewe, 2016-04-27 This book presents a proposal for designing business process management BPM systems that comprise much more than just process modelling Based on a purified Business Process Model and Notation BPMN variant the authors present proposals for several important issues in BPM that have not been adequately considered in the BPMN 2.0 standard It focusses on modality as well as actor and user interaction modelling and offers an enhanced communication concept In order to render models executable the semantics of the modelling language needs to be described rigorously enough to prevent deviating interpretations by different tools For this reason the semantics of the necessary concepts introduced in this book are defined using the Abstract State Machine ASM method Finally the authors show how the different parts of the model fit together using a simple example process and introduce the enhanced Process Platform eP2 architecture which binds all the different components together The resulting method is named Hagenberg Business Process Modelling H BPM after the Austrian village where it was designed The motivation for the development of the H BPM method stems from several industrial projects in which business analysts and software developers struggled with redundancies and inconsistencies in system documentation due to missing integration The book is aimed at researchers in business process management and industry 4.0 as well as advanced professionals in these areas Business Processes for Business Communities Frank

Schönthaler, Gottfried Vossen, Andreas Oberweis, Thomas Karle, 2012-03-14 After a brief introduction to the topic of business process modeling the book offers a quick start into model based business process engineering After that the foundations of the modeling languages used are conveyed Meaningful examples are in the foreground each of the underlying formalisms is treated only as far as needed Next the Horus Method is described in detail The book defines a sequence of activities which finally leads to the creation of a complete business process model The Horus Method incidentally is not bound to the use of the Horus software tools It can be used with other tools or if necessary be used even without tool support Important application fields of business process engineering are described where the spectrum ranges from business process reengineering to the development and implementation of information systems The book concludes with an outlook on the future of business process engineering and highlights current research activities in the area *Advances in Enterprise*

Engineering III Antonia Albani, Jan Dietz, 2009-06-04 In the era of continuous changes in internal organizational settings and external business environments such as new regulations and business opportunities modern enterprises are subject to extensive research and study For the understanding design and engineering of modern enterprises and their complex business processes the discipline of enterprise engineering requires sound engineering principles and systematic approaches based on rigorous theories Along with that a paradigm shift seems to be needed for addressing these issues adequately The main paradigm shift is the consideration of an enterprise and its business processes as a social system In its social setting an enterprise and its business processes represent actors with certain authorities and assigned roles who assume certain

responsibilities in order to provide a service to its environment Second to that a paradigm shift is to look at an enterprise as an artifact purposefully designed for a certain mission and goal The need for this paradigm shift along with the complexity and agility of modern enterprises gives inspiration for the emerging discipline of enterprise engineering that requires development of new theories and methodologies To this end the prominent methods and tools of modeling and simulation play a significant role Both conceptual modeling and simulation are widely used for understanding analyzing and engineering an enterprise its organization and business processes

Natural Language in Business Process Models Henrik Leopold, 2013-12-12 Natural language is one of the most important means of human communication It enables us to express our will to exchange thoughts and to document our knowledge in written sources Owing to its substantial role in many facets of human life technology for automatically analyzing and processing natural language has recently become increasingly important In fact natural language processing

tools have paved the way for entirely new business opportunities. The goal of this book is to facilitate the automatic analysis of natural language in process models and to employ this analysis for assisting process model stakeholders. Therefore, a technique is defined that automatically recognizes and annotates process model element labels. In addition, this technique is leveraged to support organizations in effectively utilizing their process models in various ways. The book is organized into seven chapters. It starts with an overview of business process management and linguistics and continues with conceptual contributions on parsing and annotating process model elements with the detection and correction of process model guideline violations with the generation of natural language from process models and finally ends with the derivation of service candidates from process models.
