A First Course in Systems Biology Eberhard O. Voit,2012-03-28 A First Course in Systems Biology is a textbook designed for advanced undergraduate and graduate students Its main focus is the development of computational models and their applications to diverse biological systems Because the biological sciences have become so complex that no individual can acquire complete knowledge in any given area of specialization the education of future systems biologists must instead develop a student's ability to retrieve reformat merge and interpret complex biological information This book provides the reader with the background and mastery of methods to execute standard systems biology tasks understand the modern literature and launch into specialized courses or projects that address biological questions using theoretical and

computational means The format is a combination of instructional text and references to primary literature complemented by sets of small scale exercises that enable hands on experience and larger scale often open ended questions for further reflection *The Biology of mRNA: Structure and Function* Marlene Oeffinger, Daniel Zenklusen, 2019-12-06 The book provides an overview on the different aspects of gene regulation from an mRNA centric viewpoint including how mRNA is assembled and self assembles in a complex consisting of RNA and proteins and how its ability to be translated at the right time and space depends on many processes acting on the mRNAs leading to a properly folded complex This book shows how new technologies have led to a better understanding of these processes and their connected diseases The book is written for scientists in fundamental and applied biomedical research working on different aspects of gene regulation It is also targeted to an audience that is not implicated in these fields directly but wants to gain a better understanding of mRNA biology

Applications of Continuous and Steady-State Methods to Root Biology John G. Torrey, Lawrence J. Winship, 2012-12-06
This book provides an excellent illustration of the interrelationship between progress in scientific methodology and conceptual advances and its publication should contribute to further advances. It is well known that major advances in understanding often follow the development of new methods. The development of the acetylene reduction assay for nitrogenase activity provides a good example of this interrelationship between theory and methods. Theoretical knowledge led to a search for substrates for nitrogenase that could be assayed for more easily than ammonium, the normal product of the enzyme. The discovery of the reduction of acetylene to ethylene by nitrogenase provided the ideal answer to the problem by providing a rapid, specific, nondestructive and inexpensive assay for nitrogenase activity. This assay is now used by almost every laboratory doing research on nitrogen fixation. However, further use and development of the acetylene reduction assay has shown that it can underestimate nitrogenase activity and can even give incorrect relative values under some circumstances. The major problem is that exposure of legume nodules to acetylene can cause a large increase in the resistance to oxygen diffusion into the nodule. This reduced supply of oxygen decreases the rate of nitrogenase activity within a few minutes.
