

7.1 Structure of Transport Tissues:

Angiosperms are the flowering plants which are at the furthest point of the evolution spectrum.

Monocotyledons:

- One seeded leaves which are long and narrow and have veins running parallel to the length of the leaf.
- The flowering parts are always grouped in 3's with no leaf stalk e.g. grasses, lilies and palms.

Dicotyledons:

- Two seeded leaves with broad leaves which have branched leaf veins sprouting from the central line.
- The flowering part is grouped in 4's or 5's e.g. beans, shrubs etc.

Cell types in plant tissues:

- Xylem (vessel and tracheid) - dead and lignified structure which transports water and minerals from the roots to the leaves.
- Phloem sieve element - Alive structure which transports sugars, aa and hormones round the plant, from source to sink.
- Phloem companion cells - provide metabolic support to the sieve tubes, by moving substances in and out.
- Parenchyma - storage of foods like starch and when turgid they support the plant from Wilting - they are generalised cells and also transport water and minerals through the walls, as well as gas exchange between the cells.
- Sclerenchyma - dead and lignified cells which support in areas of non-active growth e.g. lignin and cellulose in cell walls.
- Collenchyma - modified form of parenchyma with extra cellulose in corners of the cell - provide strength and support in areas of active growth.
- Meristem - stem cell tissue

Root:

- The cross section of a root shows the presence of a single, central vascular bundle

- The endodermis controls the entry of solutes into the cell and prevents pathogen entry - water moves by symplast pathway.
- The cross section of a stem shows several vascular bundles arranged in characteristic patterns.
- The xylem is stained red and found on the central side of the cambium wall.

- Can be differentiated to the other plant cross sections due to...
 - Fibre cap of Lignified sclerenchyma above the xylem vessels, creating red section.
 - Ring of cambium moving through every vascular bundle - they contain meristem tissue which can divide to make the ring larger and provide space for more vascular bundles to grow.
 - Multiple vascular bundles in a ring-like structure.

Africa United Nations Environment Programme, 2008 This stunning 400 page Atlas is a unique and powerful publication which brings to light stories of environmental change at more than 100 locations spread across every country in Africa There are more than 300 satellite images 300 ground photographs and 150 maps along with informative graphs and charts that

give a vivid visual portrayal of Africa and its changing environment that provide scientific evidence of the impact that natural and human activities have had on the continent's environment over the past several decades. The observations and measurements of environmental change help gauge the extent of progress made by African countries towards reaching the United Nations Millennium Development Goals. More importantly, this book contributes to the knowledge and understanding that are essential for adaptation and remediation and should be of immense value to all those who want to know more about Africa and who care about the future of this continent. Conservation and the Genetics of Populations Fred W. Allendorf, Gordon H. Luikart, Sally N. Aitken, 2012-12-17 Loss of biodiversity is among the greatest problems facing the world today. *Conservation and the Genetics of Populations* gives a comprehensive overview of the essential background concepts and tools needed to understand how genetic information can be used to conserve species threatened with extinction and to manage species of ecological or commercial importance. New molecular techniques, statistical methods, and computer programs. Genetic principles and methods are becoming increasingly useful in the conservation of biological diversity. Using a balance of data and theory coupled with basic and applied research examples, this book examines genetic and phenotypic variation in natural populations, the principles and mechanisms of evolutionary change, the interpretation of genetic data from natural populations, and how these can be applied to conservation. The book includes examples from plants, animals, and microbes in wild and captive populations. This second edition contains new chapters on Climate Change and Exploited Populations, as well as new sections on genomics, genetic monitoring, emerging diseases, metagenomics, and more. One third of the references in this edition were published after the first edition. Each of the 22 chapters and the statistical appendix have a Guest Box written by an expert in that particular topic, including James Crow, Louis Bernatchez, Loren Rieseberg, Rick Shine, and Lisette Waits. This book is essential for advanced undergraduate and graduate students of conservation genetics, natural resource management, and conservation biology, as well as professional conservation biologists working for wildlife and habitat management agencies.
