Gómez-Pérez, 2010-07-08 The development of knowledge based systems is usually approached through the combined skills of knowledge engineers KEs and subject matter experts SMEs One of the most critical steps in this activity aims at transferring knowledge from SMEs to formal machine readable representations which allow systems to reason with such knowledge However this is a costly and error prone task Alleviating the knowledge acquisition bottleneck requires enabling SMEs with the means to produce the desired knowledge representations without the help of KEs This is especially difficult in the case of complex knowledge types like processes The analysis of different application domains uncovers that process knowledge is one of the most frequent knowledge types whose complexity requires specific means to enable SMEs to represent processes in a computational form Additionally such complexity and the increasingly large amount of data that process executions generate in knowledge intensive domains like Biology or Astronomy requires analytical means with high abstraction capabilities to support SMEs in the analysis of such processes This book presents methods and tools that enable SMEs to acquire process knowledge from the domains formally represent such knowledge reason about it and understand process executions by analyzing their provenance We describe the utilization of Problem Solving Methods as the main knowledge artifacts for process acquisition and analysis in two innovative ways First as formalizations of the reasoning strategies needed for processes and second as high level domain independent and reusable abstractions of process knowledge to provide SMEs with interpretations of process executions [Leibel and Phillips Textbook of Radiation Oncology - E-Book](#) Richard Hoppe, Theodore L.
