

## Biology Chapter 16 Notes

**16.1-16.6 Population ecology is the study of how populations interact with their environments.**

❖ **16.1 What is ecology?**

- Ecology = a subdiscipline of biology defined as the study of all interactions between organisms and their environments
- There are many different levels:
  - Individuals: individual organisms
  - Populations: groups of individual organisms that interbreed with each other
  - Communities: populations of different species that interact with each other within a locale
  - Ecosystems: all living organisms, as well as non-living elements, that interact in a particular area
- Population ecology = a subfield of ecology that focuses on populations of organisms of a species and how they interact with the environment
- They also examine the special case of human population growth and its impact on the environment as well as the ways in which ecological knowledge can contribute to effective conservation policies

❖ **16.2 A population perspective is necessary in ecology.**

- Population ecology examines features that cannot be studied within an individual organism, such as population size.
- We must consider the entire group of individuals that regularly exchange genes in a particular locale.

❖ **16.3 Populations can grow quickly for a while, but not forever.**

- Growth rate of a population = the change in the number of individuals in the population in some unit of time, such as a year
- To calculate the growth rate, we need two things:
  - The number of individuals in the population now,  $N$
  - The per capita growth rate,  $r$ , which is simply the birth rate minus the death rate
  - Growth rate =  $r \times N$
- If the birth rate is greater than the death rate, the population gets bigger
- If the death rate is bigger than the birth rate, the population gets smaller
- Exponential growth = growth of a population at a rate that is proportional to its current size
- Populations tend to grow exponentially, but this growth is eventually limited

❖ **16.4 A population's growth is limited by its environment.**

- Population density = the number of individuals in a given area

environmental challenges at once global technological and commercial require new behaviors new institutions and new principles In this highly original work Thomas Princen builds one such principle sufficiency Sufficiency is not about denial not about sacrifice or doing without Rather when resource depletion and overconsumption are real sufficiency is about doing well It is about good work and good governance it is about goods that are good only to a point With examples ranging from timbering and fishing to automobility and meat production Princen shows that sufficiency is perfectly sensible and yet absolutely contrary to modern society s dominant principle efficiency He argues that seeking enough when more is possible is both intuitive and rational personally organizationally and ecologically rational And under global ecological constraint it is ethical Over the long term an economy indeed a society cannot operate as if there s never enough and never too much
