Manual Asymmetries, Handedness and Motor Performance Pamela Bryden, Andrea Helen Mason, Claudia L. R. Gonzalez, 2016-06-10 The performance of most tasks with one hand typically the right is a uniquely human characteristic Not only do people prefer to use one hand rather than the other but also they usually perform tasks faster and more accurately with this hand The study of manual asymmetries and what such performance differences between the two hands reveal about brain organization and motor function has been a topic of considerable research over the last several decades The aim of this Research Topic is to review and further explore the origins of manual asymmetries and their relationship to handedness unimanual and bimanual motor performance and brain function The articles included here involve original research conducted in humans or non human models species as well as theoretical perspectives review articles and meta analyses

Manual Skills, Handedness, and the Organization of Language in the Brain Gregory Króliczak, Claudia L. R. Gonzalez, David P. Carey, 2019-08-15 Whereas the cerebral specialization for skilled manual actions praxis seems closely linked to dominance for language with both functions left lateralized in the vast majority of humans the neural correlates of hand preference are still less well understood Indeed as a combination of inherited and non inherited genomic factors i e direct parental and concealed environmental contributions handedness in contrast to language is less likely to have strong genetic indices and clearly lateralized functional organization What about eye dominance unimanual and bimanual object manipulation and gestures or attentional systems and the related egocentric or allocentric coding of space Are these different categories

functionally and structurally interconnected Is their development and contribution to task performance linked even if they are differently lateralized How are they connected to language learning or its development In trying to understand these relationships and their neural underpinnings we obtain a new insight into fundamental human behaviors which depend either on shared or distinct cerebral resources that must nevertheless be harmonized by higher order cerebral processing In this Research Topic we assembled a dozen of original research contributions as well as articles with more theoretically driven perspectives that directly speak to these issues Hopefully this work will serve as a foundation for further discussions and will stimulate new research in this fascinating domain

Gupta, 2011-05-18 Given the growing size and heterogeneity of Systems on Chip SOC the design process from initial specification to chip fabrication has become increasingly complex This growing complexity provides incentive for designers to use high level languages such as C SystemC and SystemVerilog for system level design While a major goal of these high level languages is to enable verification at a higher level of abstraction allowing early exploration of system level designs the focus so far for validation purposes has been on traditional testing techniques

such as random testing and scenario based testing This book focuses on high level verification presenting a design methodology that relies upon advances in synthesis techniques as well as on incremental refinement of the design process These refinements can be done manually or through elaboration tools This book discusses verification of specific properties in designs written using high level languages as well as checking that the refined implementations are equivalent to their high level specifications The novelty of each of these techniques is that they use a combination of formal techniques to do scalable verification of system designs completely automatically The verification techniques presented in this book include methods for verifying properties of high level designs and methods for verifying that the translation from high level design to a low level Register Transfer Language RTL design preserves semantics Used together these techniques guarantee that properties verified in the high level design are preserved through the translation to low level RTL **Cars & Parts** ,1989
