**Aqueous-phase Catalytic Conversions of Renewable Feedstocks for Sustainable Biorefineries** Georgios Papadogianakis, Roger Arthur Sheldon, Yulong Wu , Dmitry Yu. Murzin, 2024-08-23 Today there is growing interest in aqueous phase catalytic conversions for the valorization of renewable biomass based feedstocks for biorefineries to produce in a sustainable way biofuels chemicals power energy materials pharmaceuticals and food This is because of the highly polar nature of water which makes it an ideal medium to convert polar biomass based lignocellulose cellulose hemicellulose lignin with high oxygen content and their upgraded products such as hydrophilic carbohydrates platform chemicals and their derivatives Another reason which makes water the solvent of choice is that water itself is involved either as a reagent or as a byproduct even in large amounts in typical conversions for the valorization of biomass The obtained intermediates further react in the aqueous medium often without any separation and purification to manufacture more valuable products This results in substantial energy savings lower emissions and economic benefits Furthermore water could act as a catalyst in conversions of biomass based feedstocks such as in liquefaction reactions under subcritical conditions Moreover novel types of catalytic reactivity have been observed in the aqueous solvent not only with water soluble transition metal catalytic complexes but also with conventional heterogeneous catalysts and catalytic nanoparticles in a broad spectrum of different reactions such as inter alia aldol condensations and hydrogenation reactions For example in the aqueous phase hydrogenation of the biomass based key platform chemical levulinic acid into valerolactone and beyond employing heterogeneous catalysts and nanoparticles the presence of water has a beneficial effect and accelerates the reaction rates whereas in organic solvents much lower activities were observed This promotional effect of water in the hydrogenation of levulinic acid was proved by many experimental and theoretical studies using a broad spectrum of different types of catalytic systems

Self-Organizing Nanovectors for Drug Delivery Giuseppe De Rosa,Pietro Matricardi,2020-04-17 Nanomedicine represents one of the most investigated areas in the last two decades in the field of pharmaceuticals Several nanovectors have been developed and a growing number of products have been approved It is well known that many biomaterials are able to self organize under controlled conditions giving rise nanostructures Polymers lipids inorganic materials peptides and proteins

and surfactants are examples of such biomaterials and the self assembling property can be exploited to design nanovectors that are useful for drug delivery The self organization of nanostructures is an attractive approach to preparing nanovectors avoiding complex and high energy consuming preparation methods and in some cases facilitating drug loading procedures Moreover preparations based on these biocompatible and pharmaceutical grade biomaterials allow an easy transfer from the lab to the industrial scale This book reports ten different works and a review aiming to cover multiple strategies and pharmaceutical applications in the field of self organizing nanovectors for drug delivery *The Evolution of Neuropeptides - A Stroll Through the Animal Kingdom: Updates from the Ottawa 2019 ICCPB Symposium and Beyond* Klaus H.
