Fundamentals of Durable Reinforced Concrete Mark G. Richardson, 2023-11-03 This new edition sets out the fundamental aspects of concrete durability with an emphasis on sustainability and carbon neutrality through performance based methodologies Global approaches to managing durability are explained from both a prescriptive and performance viewpoint Achieving a balance between the interactive factors influencing durability and sustainability is supported by an explanation of the physical and chemical phenomena at play determination of key performance parameters by mathematical modelling and physical testing and current guidance for good practice New chapters and sections examine the holistic approach to durability and significant aspects of traditional and new cementitious systems The full range of threats to durability are covered in this single volume including reinforcement corrosion carbonation chloride ingress freeze thaw effects sulfate attack acid and seawater attack alkali aggregate reaction cracking abrasion erosion cavitation and weathering The book presents a framework for specification through internationally adopted codes and standards and summarises the background to probabilistic approaches to durability design providing a state of the art review of mathematical modelling of deterioration mechanisms along with current directions in test methods for performance based specifications

Fundamentals of Durable Reinforced Concrete is an essential reference on concrete durability for specifiers and researchers and is also accessible to undergraduate students

Computational Modelling of Concrete and Concrete Structures Günther Meschke, Bernhard Pichler, Jan G. Rots, 2022-05-22 Computational Modelling of Concrete and Concrete Structures contains the contributions to the EURO C 2022 conference Vienna Austria 23-26 May 2022 The papers review and discuss research advancements and assess the applicability and robustness of methods and models for the analysis and design of concrete fibre reinforced and prestressed concrete structures as well as masonry structures Recent developments include methods of machine learning novel discretisation methods probabilistic models and consideration of a growing number of micro structural aspects in multi scale and multi physics settings In addition trends towards the material scale with new fibres and 3D printable concretes and life cycle oriented models for ageing and durability of existing and new concrete infrastructure are clearly visible Overall

computational robustness of numerical predictions and mathematical rigour have further increased accompanied by careful model validation based on respective experimental programmes The book will serve as an important reference for both academics and professionals stimulating new research directions in the field of computational modelling of concrete and its application to the analysis of concrete structures EURO C 2022 is the eighth edition of the EURO C conference series after Innsbruck 1994 Bad Gastein 1998 St Johann im Pongau 2003 Mayrhofen 2006 Schladming 2010 St Anton am Arlberg 2014 and Bad Hofgastein 2018 The overarching focus of the conferences is on computational methods and numerical models for the analysis of concrete and concrete structures *2022 fib Awards for Outstanding Concrete Structures* FIB – International Federation for Structural Concrete, 2022-06-15 The fib has two major missions now One is to work toward the publication of the Model Code 2020 and the other is to respond to the global movement toward carbon neutrality While the former is steadily progressing toward completion the latter will require significant efforts for generations to come As we all know cement the primary material for concrete is a sector that accounts for 8.5% of the world's CO<sub>2</sub> emissions And the structural concrete that fib handles consume 60% of that In other words we need to know the reality that our structural concrete is emitting 5% of the world's CO<sub>2</sub> From now on fib members suppliers designers builders owner's engineers and academic researchers will be asked how to solve this difficult problem In general most of the CO<sub>2</sub> emissions in the life cycle of structural concrete come from the production stage of materials and the use stage after construction i.e. A1 to A3 and B1 to B5 processes as defined in EN15978 Cement and steel sectors which are the main materials for structural concrete are expected to take various measures to achieve zero carbon in their respective sectors by 2050 Until then we must deal with the transition with our low carbon technologies Regarding the production stage the fib has recently launched TG4.8 Low carbon concrete And the latest low carbon technologies will be discussed there On the other hand in the use stage there is very little data on the relationship between durability and intervention and maintenance so far The data accumulation here is the work of the fib a group of various experts on structural concrete Through life management using highly durable structures and precise monitoring will enable to realize minimum maintenance in the use stage and to minimize CO<sub>2</sub> emissions Furthermore it is also possible to contribute to the reduction of CO<sub>2</sub> emissions in the further stage after the first cycle by responding to the circular economy that is deconstruction C reuse and recycle D However the technology in this field is still in its infancy and further research and development is expected in the future As described above structural concrete can be carbon neutral in all aspects of its conception and it can make a significant contribution when it is realized The fib will have to address these issues in the future Of course it will not be easy and it will take time However if we do not continue our efforts as the only international academic society on structural concrete in the world to achieve carbon neutrality the significance of our very existence may be questioned Long before Portland cement was invented Roman concrete made of volcanic ash and other materials was the ultimate low carbon material and is still in use 2 000 years later

because of its non reinforced structure and lack of deterioration factors Reinforced concrete which made it possible to apply concrete to structures other than arches and domes is only 150 years old Prestressed concrete is even younger with only 80 years of history Now that we think about it we realize that Roman concrete which is non reinforced low carbon concrete is one of the examples of problem solving that we are trying to achieve We have new materials such as coated reinforcement FRP and fiber reinforced concrete which can be used in any structural form To overcome this challenge with all our wisdom would be to live up to the feat the Romans accomplished 2 000 years ago Realizing highly durable and elegant structures with low carbon concrete is the key to meet the demands of the world in the future I hope you will enjoy reading this AOS brochure showing the Outstanding Concrete Structures Awards at the fib 2022 Congress in Oslo And I also hope you will find some clues for the challenges we are facing
