**Modeling** Monson H. Hayes, 1996-04-19 This new text responds to the dramatic growth in digital signal processing DSP over the past decade and is the product of many years of teaching an advanced DSP course at Georgia Tech While the focal point of the text is signal modeling it integrates and explores the relationships of signal modeling to the important problems of optimal filtering spectrum estimation and adaptive filtering Coverage is equally divided between the theory and philosophy of statistical signal processing and the algorithms that are used to solve related problems The text reflects the author's philosophy that a deep understanding of signal processing is accomplished best through working problems For this reason the book is loaded with worked examples homework problems and MATLAB computer exercises While the examples serve to illustrate the ideas developed in the book the problems seek to motivate and challenge the student and the computer exercises allow the student to experiment with signal processing algorithms on complex signals Professor Hayes is recognized as a leader in the signal processing community particularly for his work in signal reconstruction and image processing This text is suitable for senior graduate level courses in advanced DSP or digital filtering found in Electrical Engineering Departments Prerequisites include basic courses in DSP and probability theory      **Digital Signal Processing**

**Hartley Transform** Keith Jones,2010-03-10 Most real world spectrum analysis problems involve the computation of the real data discrete Fourier transform DFT a unitary transform that maps elements  $N$  of the linear space of real valued  $N$  tuples  $R$  to elements of its complex valued  $N$  counterpart  $C$  and when carried out in hardware it is conventionally achieved via a real from complex strategy using a complex data version of the fast Fourier transform FFT the generic name given to the class of fast algorithms used for the efficient computation of the DFT Such algorithms are typically derived by exploiting the property of symmetry whether it exists just in the transform kernel or in certain circumstances in the input data and or output data as well In order to make effective use of a complex data FFT however via the chosen real from complex  $N$  strategy the input data to the DFT must first be converted from elements of  $R$  to  $N$  elements of  $C$  The reason for choosing the computational domain of real data problems such as this to be  $C$  rather than  $R$  is due in part to the fact that computing equipment manufacturers have invested so heavily in producing digital signal processing DSP devices built around the design of the complex data fast multiplier and accumulator MAC an arithmetic unit ideally suited to the implementation of the complex data radix 2 butterfly the computational unit used by the familiar class of recursive radix 2 FFT algorithms **Basic**
