Mineral Solubilizing Microorganisms (MSM) and their Applications in Nutrient Bioavailability, Bioweathering and Bioremediation, Volume II Muhammad Zahid Mumtaz, Maqshoof Ahmad, Hassan Etesami, Adnan Mustafa, 2024-04-18

Bioweathering is the dissolution of rocks and mineral substrates carried out by microorganisms along with mechanical and chemical processes. The application of bacteria in biomining is a biotechnological approach for the extraction and recovery of metals from ores. Microbes interact with minerals as a strategy to colonize and exploit habitats where the environmental parameters disadvantage other microorganisms and they demonstrate the capacity to scavenge critical elements with low bioavailability such as iron and phosphorus. There is an ongoing need to improve soil fertility and crop production particularly in dry places to remediate toxic soils and clean stone artworks and structures. A more complete understanding of the ecology of mineral weathering processes mediated by the microbiome may provide a significant opportunity for researchers to develop novel solutions to developing challenges in agriculture, the environment and industry.

Application of LC-MS/MS in the Mycotoxins Studies Laura Gámiz-Gracia, Ana M. García-Campaña, Natalia Arroyo-Manzanares, 2020-06-17

Mycotoxins are secondary metabolites produced by the fungi of different species mainly *Aspergillus*, *Fusarium* and *Penicillium* with toxic effects for humans and animals. These mycotoxins can contaminate food and feed. The European Union (EU) has established the maximum permitted or recommended levels for well known mycotoxins in different foodstuffs. However, there are other mycotoxins that are not included in the regulations, the emerging mycotoxins whose toxicity is still not clear and the modified or masked mycotoxins produced as a consequence of a detoxification strategy of the host plant of the fungus or during food processing. These mycotoxins could pose a risk and should also be taken into account. In order to assure consumers' health, analytical methods for the accurate determination of mycotoxins in different food matrices and feeds are required. In this sense, liquid chromatography tandem mass spectrometry (LC-MS/MS) is a powerful tool for their unique identification and quantification. Moreover, the use of high resolution mass spectrometry (HRMS) allows one to identify novel mycotoxins and targeted/untargeted approaches for study. This Special Issue compiles recent applications of LC-MS/MS in mycotoxin studies as well as the development and validation of new analytical methods for their identification and quantification in different food matrices and feed occurrence studies and the biomonitoring of mycotoxins and their metabolites in biological fluids.
