

Find the length of an arc that subtends a central angle of 120° in a circle of radius 10 centimeters.

$$r = 10 \text{ cm}$$

$$\theta = 120^\circ * \frac{\pi \text{ rad}}{180^\circ} = \frac{2\pi}{3} \text{ rad}$$

$$s = r\theta$$

$$s = (10 \text{ cm}) * \left(\frac{2\pi}{3} \text{ rad}\right)$$

$$s = \frac{20\pi}{3} \text{ cm}$$

Optimization—Theory and Applications L. Cesari, 2012-12-06 This book has grown out of lectures and courses in calculus of variations and optimization taught for many years at the University of Michigan to graduate students at various stages of their careers and always to a mixed audience of students in mathematics and engineering It attempts to present a balanced view of the subject giving some emphasis to its connections with the classical theory and to a number of those problems of economics and engineering which have motivated so many of the present developments as well

as presenting aspects of the current theory particularly value theory and existence theorems However the presentation of the theory is connected to and accompanied by many concrete problems of optimization classical and modern some more technical and some less so some discussed in detail and some only sketched or proposed as exercises No single part of the subject such as the existence theorems or the more traditional approach based on necessary conditions and on sufficient conditions or the more recent one based on value function theory can give a sufficient representation of the whole subject This holds particularly for the existence theorems some of which have been conceived to apply to certain large classes of problems of optimization For all these reasons it is essential to present many examples Chapters 3 and 6 before the existence theorems Chapters 9 and 11 16 and to investigate these examples by means of the usual necessary conditions sufficient conditions and value function theory *Applied Mechanics Reviews* ,1974
