of surface plasmon resonances are described as well as those mechanisms related to related phenomena such as surface enhanced spectroscopies or plasmonic chirality Under the guidance of theoretical models wet chemistry methods have been implemented toward the synthesis of a wide variety of nanoparticles with different compositions and tailored morphology But often the optimal nanoarchitecture requires post synthesis treatments including functionalization of nanoparticle surfaces application of external stimuli toward self assembly into well defined supraparticle structures and so called supercrystals All such nanomaterials can find applications in various biomedical aspects most often in relation to diagnosis through either the detection of disease biomarkers at extremely low concentrations or the design of bioimaging methods for in vivo monitoring Additionally novel therapeutic tools can also profit from plasmonic nanomaterials such as photothermal therapy or nanocatalysis The reference set thus offers comprehensive information of an extremely active subset within the world of plasmonic nanomaterials and their applications which aims at not just collecting existing knowledge but also promoting further research and technology transfer into the market and the clinic

**Handbook of Air Quality and Climate Change** Hajime Akimoto, Hiroshi Tanimoto, 2023-09-27

This handbook covers the air quality air pollution from the viewpoints of causing impacts on human ecosystem health and climate change Traditionally air pollution has been a concern mainly in terms of its impacts on human health and it is still an immediate public and governmental concern in most Asian countries However in recent years so called extreme weather events such as stronger tropical cyclones flooding drought and other phenomena have been manifested causing tremendous losses of human lives and properties Importantly climate models tell us that such extreme weather events are actually induced by anthropogenic global warming It has been pointed out that mitigation or alleviation of such climate change leading to the extreme weather events in the next 30 years

can be possible only by reducing air pollutants with positive radiative forcing such as ozone or methane which are called short lived climate pollutants SLCPs Here concerns about mitigation of air pollutants from the points of human health and climate change have merged This book covers different kinds of air pollutants and radiative forcers and how they can be measured It also mentions the situation of air pollutants in different continents and their regional impacts to human health environment and economy as well as their link to extreme weather events The book presents how the air pollution and climate change can be mitigated and how clean air technologies and international initiatives for co controlling air pollution and climate change have been developed
