Robotic Welding, Intelligence and Automation Tzyh-Jong Tarn, Shan-Ben Chen, Changjiu Zhou, 2007-09-11 Robotic welding systems have been used in different types of manufacturing They can provide several benefits in welding applications The

most prominent advantages of robotic welding are precision and productivity. Another benefit is that labor costs can be reduced. Robotic welding also reduces risk by moving the human welder operator away from hazardous fumes and molten metal close to the welding arc. The robotic welding system usually involves measuring and identifying the component to be welded, positioning it, controlling the welding parameters, and documenting the produced welds. However, traditional robotic welding systems rely heavily upon human intervention. It does not seem that the traditional robotic welding techniques by themselves can cope well with uncertainties in the welding surroundings and conditions, e.g., variation of weld pool dynamics, fluxion, solid weld torch, and etc. On the other hand, the advent of intelligent techniques provides us with a powerful tool for solving demanding real-world problems with uncertain and unpredictable environments. Therefore, it is interesting to gather current trends and to provide a high quality forum for engineers and researchers working in the field of intelligent techniques for robotic welding systems. This volume brings together a broad range of invited and contributed papers that describe recent progress in this field.

Robot Manipulators Marco Ceccarelli, 2008-09-01 In this book we have grouped contributions in 28 chapters from several authors all around the world on the several aspects and challenges of research and applications of robots with the aim to show the recent advances and problems that still need to be considered for future improvements of robot success in worldwide frames. Each chapter addresses a specific area of modeling, design, and application of robots but with an eye to give an integrated view of what makes a robot a unique modern system for many different uses and future potential applications. Main attention has been focused on design issues as thought challenging for improving capabilities and further possibilities of robots for new and old applications as seen from today technologies and research programs. Thus, great attention has been addressed to control aspects that are strongly evolving also as function of the improvements in robot modeling, sensors, servo power systems, and informatics. But even other aspects are considered as of fundamental challenge both in design and use of robots with improved performance and capabilities like for example kinematic design, dynamics, vision integration.

Billing, Peter Thorvald, Patricia Helen Rosen, 2025-03-13 Advanced collaborative robotics will be one of the most promising technologies in future industry e.g. in manufacturing logistics or construction. Human robot interaction and collaboration will be crucial for enhancing the operator's work conditions and wellbeing as well as production performance. In that regard human factors with a special emphasis on cognitive ergonomics are fundamental to implementing safe fluent and efficient collaborative applications. Associated challenges and opportunities as well as design recommendations for interactive robotic systems must be considered likewise. The general target of the present Research Topic is to contribute to the expansion of knowledge in this field promoting research focused on the study of human factors and cognitive ergonomics in user centered and collaborative applications in industrial settings. In particular it aims to enhance the benefits related to human robot interaction by limiting as much as possible the negative effects on the user's safety and wellbeing that can arise from an improper design and management of collaborative applications as well as optimizing production system performances.
