Interface Between Innate And Acquired Immunity:

The Interface Between Innate and Acquired Immunity M.D. Cooper, H. Koprowski, 2013-03-09 All multicellular organisms may possess innate immunity mediated by defense mechanisms with which the organism is born. In recent years much has been learned about the diversity of innate immune mechanisms. A large array of naturally produced antimicrobial peptides has been defined. A variety of cell surface receptors that recognize common patterns displayed by infectious organisms have been identified along with the intracellular pathways that these receptors use to activate cellular defense functions. Cell surface receptors on natural killer (NK) cells have been shown to sense microbial invasion in neighboring cells thereby setting into motion their elimination by cytotoxic mechanisms. Other receptors have been found to facilitate phagocytosis and intracellular killing of microbes by phagocytic cells. These and other natural defense mechanisms have traditionally been viewed as the first line of body defense in vertebrate species that also possess the capacity for acquired or adaptive immunity. Sharks and all of the other jawed vertebrates generate large repertoires of T and B lymphocyte clones that display different antigen specific receptors in the form of T cell receptors (TCR) and immunoglobulins (Ig) that allow them to recognize and respond to antigens in collaboration with antigen presenting cells. Memory T and B cells are then generated to allow faster and heightened cellular and humoral immune responses on secondary antigen encounter. In recent years it has also become obvious that innate immune responses can directly influence adaptive immune responses in ways that will enhance body defense.

decidual macrophages CD163 CD206 CD209 IL 10 CCL18 and the selective expansion of functionally suppressive CD25^{high} Foxp3 Treg cells the latter partly mediated through IL 10 TGF and TRAIL The placenta also limited activation of Th cells for instance by generally reduced cytokine production Our data show that the placenta has a unique ability to induce tolerogenic immune cells with a reduced inflammatory potential which is essential for maintaining tissue integrity and preventing inflammation induced fetal loss

Glycans: Molecules at the Interface of Immunity and Disease Shoib Sarwar Siddiqui, Raghavendra Kikkeri Venkatanarayan, Stevan Springer, 2024-01-17 Glycans are complex multi unit carbohydrate structures that cover the surfaces of cells and guide cellular interactions Glycobiology studies the synthesis structure function regulation and evolution of glycans and glycan binding molecules Glycans are synthesized and added as modifications to proteins lipids and RNA Though they are often associated with functions outside of cells glycoproteins and glycolipids are most often extracellular or secreted glycans are also active within cells Glycans are known to have diverse physiological roles ranging from cell adhesion maintaining tissue structure and integrity to molecular recognition marking position during development or self identity in immunity and reproduction Glycans also regulate cellular activity and physiological state The families of proteins that bind glycans are called lectins Glycans and lectins are vital in many diseases such as cancer neurodegeneration inflammation allergies asthma and autoimmune disorders
